Abstract

This qualitative case study sought to understand perceptions of educators’ of color on the role of race in student discipline in a Massachusetts Public School District. Research has supported the racial disproportionality in school discipline for decades. Understanding the perceptions of educators of color regarding such disproportionality are evaluated with attention to Critical Race Theory (CRT). Such perceptions were uncovered through interviews during which members shared their personal backgrounds and experiences. Data collection also included a review of discipline data reported to the Department of Elementary and Secondary Education (DESE). My analysis focused on the role of teacher diversity and educator subjectivity in the discipline of students of color. Findings evidenced that educators of color believe in the importance of educator-student relationships and underscored that educators of color viewed their race as a valuable asset in their work with students involved in disciplinary actions. The results of this study indicated that by virtue of their race and cultural experiences, educators of color provide strong and influential role models for students. Recommendations include recording, disaggregating, and analyzing student discipline data with a focus on race and supporting the current effort to increase the number of culturally proficient educators of color in the District.
Acknowledgements

I would like to acknowledge our dissertation-in-practice team and express my sincere appreciation to Dr. Lauri Johnson and Dr. Jim Marini for providing staunch support and guidance through this incredible journey. You believed in our team throughout this entire process.

To my fellow teammates Charlie Drane, Diana Guzzi, Rod MacNeal, Leslie Patterson, and Joan Woodward, I thank you for sharing this amazing adventure with me. Your commitment and perseverance were contagious and kept our team afloat. It was an honor to get to know you personally and professionally.

My gratitude extends to Dr. Douglas R. White for his persistent encouragement of me to join the administrative ranks. Dr. White was a mentor and colleague who was both supportive and instructive throughout my entire career.

Thank you to Mrs. Sonia Tellier with whom I began both my doctoral program and my position as a superintendent. Her willingness to edit my many dissertation iterations was invaluable. Thank you for being a trusted colleague and friend during this journey.

None of this would have been possible without the love, support and patience of my family. Thank you to Eric, Timothy and Amanda, Annie, Jamie and Hannah, and Michael for giving me the space and time to complete this chapter in my life.
Dedication

To my dad, John V. Magnani, who always recognized and encouraged my uniqueness and potential. I only wish he could witness my graduation.

To my grandmother, Abigail Josephine Powers, for teaching me to persevere, depend on myself, and design my own personal journey.

Finally, I dedicate this work to my incredible husband Eric Turkington. Eric has always been my North Star. His love, guidance, and steadfast support have guided me through this and many other chapters in my life. I look forward to co-authoring the next chapter together.

CHAPTER 1 \(^1\)

PROBLEM STATEMENT AND LITERATURE REVIEW

**Statement of Problem and Purpose**

The demographics of the United States population are shifting dramatically. This shift is due to increased birth rates within populations of color and immigration (Boser, 2014). As a result, schools that once catered to a mostly White student body are now educating children from a number of different races and ethnicities (Frey, 2011). This is true in almost every state (Boser) and in urban (Achinstein, Ogawa, Sexton, & Freitas, 2010; Justiz & Kameen, 1988), suburban (Lee, 2013; Mabokela & Madsen, 2003), and rural (Castañeda, Kambutu, & Rios, 2006) districts. Though the percentage of minority students is increasing significantly, the racial and ethnic diversity among educators has not kept pace (Ahmad & Boser, 2014; Ingersoll & May, 2011; Justiz & Kameen). The National Center for Education Statistics (NCES) (2016a) reported the distribution of U.S. public school students in the fall of 2015 as 49.2% White, 15.5% Black, 26.1% Hispanic, 5.3% Asian/Pacific Islander, 1.0% American Indian/Alaska Native, and 2.9% two or more races. The NCES (2016b) also reported the 2015 – 2016 distribution of public school teachers as 80% White non-Hispanic, 9% Hispanic, 7% non-Hispanic Black, and 2% non-Hispanic Asian.

This phenomenon has gripped the state of Massachusetts. The Massachusetts Department for Elementary and Secondary Education (DESE) reported that during the 2016-2017 school year, 38.7% of MA public school students were students of color (DESE, 2017), while teachers of color accounted for only 9.7% of the educator workforce (DESE). This racial

\(^1\) This chapter was jointly written by the authors listed and reflects the team approach of this project: Charles J. Drane III, Diana Guzzi, Roderick V. MacNeal, Jr., Leslie M. Patterson, Nancy Robbins Taylor, and Joan M. Woodward.
disproportionality is even more apparent when considering specific MA school districts. For example, in Brockton Public Schools, the disparity is 79.6% students of color to 8.2% teachers of color (DESE). Similarly, in Lowell Public Schools the disparity is 71.7% students of color to 10.4% teachers of color (DESE). These districts are just two examples among many in Massachusetts that are experiencing this significant diversity gap.

This imbalance is troubling and a matter of urgency for several reasons. First, educators of color have the potential to be social justice change agents (Villegas & Davis, 2007). Second, educators of color can serve as exemplary role models for all students, and perhaps even more so for students of color (Branch, 2001; Graham, 1987). Third, educators of color have the power to successfully enact culturally responsive practices (Villegas & Irvine, 2010). Finally, perhaps the most compelling reason is that educators of color can positively impact student achievement (Dee, 2004; Irvine, 1989).

Practitioners and policymakers have attempted to address the racial disproportionality in schools through the development and implementation of effective hiring and retention strategies. These strategies include alternative certification pathways such as Teach for America and the New Teacher Project-Fellowship, and formalized supports such as mentoring and induction programs (Bireda & Chait, 2011). Specifically in Massachusetts, to increase hiring rates of a diverse staff, educational leaders have relied on various forms of networking, relationships with colleges of education, and job fairs (Pohle, 2016). Additionally, educational leaders are promoting the teaching profession to high school students with the hope that these same students will eventually want to return to teach in their home district (Rocheleau, 2017). Furthermore, to help retain teachers of color, school districts utilize support programs such as one created by Travis Bristol, an education professor at Boston University. This
program, active in Boston Public Schools, “allows minority teachers to network with one another and discuss the challenges of navigating a white-dominated system” (“Mass. should diversify,” 2017, p. 4). In spite of these numerous established strategies, the minority student-teacher imbalance remains, and in fact, continues to grow (Boser, 2014).

Despite the imperative to hire and retain more educators of color, and a growing body of literature related to this topic, there is a gap in research. Best practices with regard to the recruitment, hiring, evaluation, and retention for this particular group of educators have yet to be established. Additionally, there is a significant gap in the existing research related to how educators of color view their pre-service preparation programs, perceive the impact of their racial/ethnic identity on their work, and experience issues related to student discipline. Furthermore, the fact that first-hand perspectives of educators of color are not consistently included in the conversation contributes to this research gap.

Therefore, the purpose of this study was to capture the perceptions of educators of color related to racial disproportionality and its impact on the educator pipeline and schools. The educator pipeline refers to preparation, recruitment, professional experiences related to students and colleagues, and retention of educators. (The definition of “educator pipeline” is discussed later in this chapter.) A primary goal of this study was to hear directly from those most impacted. Accordingly, this study was guided by the following research question: How do educators of color experience racial disproportionality within the educator pipeline and schools? Specifically, we considered the experience of educators of color and their perceptions related to pre-service programs, recruitment and hiring, student discipline, their racial/ethnic identity as it impacts students, evaluation, and job satisfaction. The primary research questions
for these individual studies are noted in Table 1.1. An abstract for each individual study can be found in Appendices A through E.

Conceptual Framework

The conceptual framework used for this study is critical race theory (CRT). The basic principle of CRT espouses that racism has become a normalized practice within our society (Ladson-Billings & Tate, 1995). The use of CRT provides a lens for identifying the inequities that have plagued the experiences of people of color in this country (Ladson-Billings, 1998). In education, the use of CRT considers the perspectives of people of color to provide a counter
story to the majoritarian viewpoint connected to positions of privilege and power acquired based upon race (Capper, 2015; DeCuir & Dixson, 2004).

Critical Race Theory (CRT) evolved from Critical Legal Studies (CLS) which scholars have used as a lens to advocate that legal policy and doctrine has contributed to an ideology that “create, support, and legitimate America's present class structure” (Crenshaw, 1988, p. 1350). Absent within CLS, was an emphasis on race, thus CRT was created in order to provide another lens for analysis (Capper, 2015; Ladson-Billings, 1998). Since its inception, CRT has been used to underscore the notion that racism has become normalized within American society and the law. This has become particularly true for citizens of color and individuals who possess a lower economic status (Capper; Ladson-Billings).

Ladson-Billings and Tate (1995) first used CRT to examine the inequities that exist within the educational system. Subsequent research has used the tenets contained within CRT to provide insight as to how structures within the educational system support White privilege over the needs of people of color. The tenets used for this study include permanence of racism, counter storytelling, critique of liberalism, and Whiteness as property (Capper, 2015).

**The Permanence of Racism**

The permanence of racism professes that racism is a constant fixture in society which “appears both normal and natural to people in this culture” (Ladson-Billings, 1998, p. 11). López (2003) states that racism is an endemic part of society that is not just defined by overt acts of oppression or violence. DeCuir and Dixson (2004) highlight how racism dictates the various structures of influence within our society, notwithstanding the field of education. Within the context of educational leadership, CRT has been useful with highlighting
how the permanence of racism has influenced the development, hiring, and retention of educators of color (Capper, 2015).

In their study which took place in a Southeastern state, McCray, Wright, and Beachum (2007) examined the placement of African-American secondary principals by surveying all public secondary school principals in that specific southeastern state. Findings from the study reveal that White principals received a greater opportunity to serve in majority Black and White school settings than their African-American counterparts. (Note: throughout our paper, the terms African-American and Black will be used interchangeably, often determined by the author being cited.) The use of race as a pre-determinant factor to fulfill principal vacancies is an example how the permanence of racism impacts placement options.

In another study by Knaus (2014), preliminary interviews were conducted to identify three case studies. The case studies included semi-structured interviews of three principals who identified two teachers in each of their buildings who exhibited the most promise for school leadership positions. The pairings included one African-American teacher and one White teacher. The principals were asked how they provided leadership opportunities for each of the identified teachers. Each teacher was interviewed about professional development and leadership positions offered to them. Findings from the study highlighted how principals categorized African-American and White teachers based upon race rather than evidence from direct observations. White teachers were perceived to be more effective at teaching the standards. In comparison, the African-American teachers in the study were relegated to being culturally responsive teaching experts and heralded for their excellent classroom management skills. In comparison, the White teachers received more responsibilities and increased opportunities to serve in leadership roles. Based upon the findings, the cultural background of
the African-American teachers influenced how their White principals viewed them and precluded them from receiving opportunities for leadership positions.

**Counter Storytelling**

The use of counter storytelling (also referred to as “counter stories” or “counter narratives”) provides an alternate perspective to the majoritarian viewpoint which is used by Whites to explain racial inequities that are “embedded with racialized omissions, distortions, and stereotypes” (Ladson-Billings, 1998, p. 18). In the context of education, counter stories of principals and other leaders of color are extremely important when seeking to provide equity (Capper, 2015).

In the study by Knaus (2014), African-American teachers who were identified by their White principal as “most promising” (p. 424) were interviewed. The findings use the input of African-American teachers to provide insight as to how they were treated differently than their White counterparts. The African-American teachers provided a counter story that conflicted with the perspectives of their supervisors.

In a study by Lynn (2002), African-American male teachers who work in South Central Los Angeles were interviewed regarding whether their racial identity informed their pedagogy, and how their racial and gender status impacted the relationships with their students. The schools in which the participants worked were majority Hispanic and African-American with 84% of the student population receiving free and reduced lunch. The participants in the study consistently exhibited a passion for working to improve the conditions of their students through teaching. The personal stories provided by interview data challenged prior research that gave a less than appealing description of educators of color.
Critique of Liberalism

Proponents of CRT advocate that liberal movements are often characterized by colorblind and neutral ideologies that fail to address the historical impact race has had in society (DeCuir & Dixson, 2004; Ladson-Billings, 1998). Color blindness, or the state of not viewing race as a relative difference, is identified as a significant contributing factor in the perpetuation of institutional racism. Researchers have discovered that when organizations, including educational systems, demonstrate colorblindness and it becomes formal or informal policy, the effects seem to be predominantly adverse for minorities (e.g., Lewis, 2001; Schofield & Anderson, 1986; Tarca, 2005). López (2003) posits that it is a fallacy to believe that a race neutral political agenda will effectively resolve racism. Substantial change can only come from a deep examination of how the impact of race has been interwoven into society which includes the field of education. Educators who fail to recognize race and one’s ethnic background “are unconscious about the ways schools are not racially neutral but reflect White culture” (Capper, 2015, p. 817).

A study by Evans (2007) examined how educators in three suburban high schools responded to the racial and demographic change that took place between 1990-2000. The participants who were interviewed included school staff, principals, and superintendents. Findings from the study reveal how teachers resisted an effort by district administration to initiate multicultural professional development. Faculty resisted under the belief that children are all the same. However, the teachers and administrators expressed a deficit perspective regarding the incoming African-American students. It was widely believed by the teachers that their new students were coming from school environments which held low academic
expectations. The examples highlighted by this study exemplify how colorblind perspectives perpetuate discriminatory practices that disregard the needs of students of color.

**Whiteness as Property**

The concept of Whiteness as property can be linked to a legal system that is based upon protecting its membership and excluding all others (Harris, 1993). Thus, this tenet espouses that the rights and privileges that are connected to being White are exclusive and can only be shared by those from this majoritarian class. Within the context of education, Whiteness as property has been utilized to explain how curriculum and the right to upper-level Advanced Placement courses have been implemented to perpetuate privilege and exclude those from marginalized backgrounds (Pollack & Zirkel, 2013). Ladson-Billings (1998) explains how remnants of African-American culture are often omitted from school curriculum. As a result, a false representation of true events distills the significance of African-American figures who have made major contributions to our society and the world.

Decuir and Dixson (2004) highlight a school that created a culture that prohibited students from wearing clothing that represented African culture. School policies aligned with White culture dictated that students must suppress or find inventive ways to express their individual ethnic or racial culture through dress. An example includes a student who wanted to wear an African headwrap during graduation, but could not because all graduates were required to wear white. To conform to the policy, the student wore a white head wrap that featured African symbols in white.

We used CRT to examine how race impacts the experience of educators of color within the Cityside Public School District. Each tenet provided a specific lens to analyze data and assist with developing an understanding of the overall research question, how educators of color
experience racial disproportionality within the educator pipeline and schools. The use of permanence of racism assisted with identifying examples of implicit bias and overt acts of racism for participants of this study. The use of counter storytelling provided a voice to participants as they shared their experiences while working in the district. The use of critique of liberalism provided a perspective as to how the use of race is considered when examining various policies and practices that help to shape the working environment in Cityside. Finally, the use of Whiteness as property helped examine how participants perceive their opportunities to build relationships, make connections, grow and achieve positions of leadership within the school district. Overall, the use of CRT provided us with a framework for assessing the conditions which educators of color need to navigate in order to thrive within the Cityside Public School District.

**Literature Review**

The value of a diverse educator workforce has been a research topic explored by many. Currently, scholars are making more efforts to highlight the voices of educators of color in their studies. This literature review was grounded in a discussion of the importance of educators of color and followed by a discussion of topics related to the experiences of educators of color within the pipeline and schools. These topics include: pre-service programs, recruitment and hiring, student discipline, racial/ethnic identity as it impacts students, evaluation, and job satisfaction.

**The Importance of Educators of Color**

As stated in this chapter’s introduction, educators of color can positively impact the school experiences for all students. They can do this through their capacity as social justice change agents, role models, and proponents of culturally responsive practices. Additionally, the
presence and approaches of educators of color can lead to increased levels of student achievement.

**Social justice change agents.** Villegas and Davis (2007) claim that teacher candidates of color, if provided with the necessary preparation, will be able to successfully translate “their commitment to making schools more equitable and just for students of color” (p. 146) into positive outcomes. Supporting this, scholars have found that some educators of color devote significant energy to explicitly addressing racism with their students (Villegas & Irvine, 2010). Specifically, these educators tackle issues pertaining to societal and institutional power, resulting in students of color more successfully navigating their world. Beauboeuf-Lafontant (1999) posits that numerous African-American teachers have “recognized the existence of oppression in their students’ lives and sought to use their personal, professional, and social power to encourage children to understand and undermine their subordination” (p. 702).

Several scholars have supported these claims through their related research. After interviewing thirty-six Black male teachers employed by the Los Angeles Unified School District, Lynn (2002) found that most of these study participants felt called “to change the lives of African American youth” (p. 125), and that teaching was a way to make this happen. They focused specifically on their work with students living in working-class and poor communities, expressing clearly that their goal was to empower these students and help them to overcome social, political, and economic barriers. Similarly, Ladson-Billings and Henry (1990) studied successful teachers of Black students in the United States and Canada. Of the thirteen teacher participants, ten of them were either African-American or Afro-Caribbean. Ladson-Billings and Henry found that these teachers engaged their students in conversations about the realities of life, addressing controversial topics that others might have determined only appropriate for adult
discussions. These teachers made sure that students contemplated the “responsibilities they have to make life better for everyone” (Ladson-Billings & Henry, p. 79).

**Role models.** Graham (1987) posits that academically successful Black teachers serve as needed role models for Black students as well as non-Black students; for all of these children need to recognize that Black people are essential members of society. Similarly, Irvine (1988) states that “white students need black teachers as role models so that they can gain accurate perceptions of our multiethnic society” (p. 506). Branch (2001) emphatically addresses this issue:

> Not enough has been said, however, about the role models that teachers of color can be for European-Americans in schools. Though teachers are not paid nearly what they are worth, they are still held in high esteem by much of the populace. … Now, children of all races are developing these positive notions about an overwhelming number of European-American teachers and very few teachers of color . . . erroneous assumptions about the intelligence of African-Americans, Latinos, and other people of color may be reinforced merely by their absence as teachers in the nation’s classrooms. (p. 258)

Also, Irvine (1988) recognizes the role that Black teachers play in negating hurtful stereotypes about their race. On a related note, Stewart, Meier, and England (1989) speak to the importance of Black teachers specifically for Black students, as they state that the mere presence of Black teachers positively impacts Black students because of the influential power of same-race role models.

It is important to highlight that while role modeling is often recognized by scholars as an important attribute of educators of color in schools, this position has not been well researched (Villegas & Irvine, 2010). In fact, Irvine (1989) and Villegas and Irvine (2010) critique the high
status that has been given to the “black teachers as role models” argument, with Villegas and Irvine (2010) noting that during the course of their research, they did not encounter any related empirical studies.

**Proponents of culturally responsive practices.** Branch (2001) addresses culturally responsive practices as he recognizes that teachers of color can play a critical role in ensuring the existence of culturally relevant curriculum. Irvine (1989) offers that Black teachers are most qualified to be “cultural translators” (p. 55) as they help marginalized Black students navigate a school culture that is not aligned with their home culture. Similarly, Villegas and Irvine (2010) discuss the idea that because teachers of color can genuinely connect with the cultural experiences of students of color, this particular type of student-teacher matching is critical. This claim is supported by the work of Ladson-Billings and Henry (1990). During their study of successful teachers of Black students, they found that these teachers connected the curriculum directly to students’ lived experiences and also employed pedagogical strategies that were based on students’ cultural roots (e.g. incorporating proverbs, call-and-response interactions, and hymns).

**Student achievement.** Irvine (1989) claims that Black teachers’ distinct approach to teaching is likely responsible for Black students’ academic success. Supporting this claim, Dee (2004) found that after one year of elementary school, students learning from Black teachers saw their math and reading scores rise. The study of Egalite, Kisida, and Winters (2015) resulted in similar findings. After analyzing a large dataset provided by the Florida Department of Education that linked approximately three million students to 92,000 teachers from the fall of 2002 to the spring of 2009, they concluded that when students are paired with a teacher of their same race/ethnicity, reading achievement was positively impacted for Black and White students.
and math achievement was positively impacted for Black, White, and Asian/Pacific Island students. Another study, with a less direct though still important connection to student achievement, was conducted by Fox (2016). Fox, analyzing survey data from the 2002 Educational Longitudinal Study, found that Black teachers in comparison to their White counterparts held higher expectations for their Black students. These Black teachers were more likely to believe that their Black students would continue their formal education past high school. Fox speaks to the significance of this finding:

> Once a teacher forms academic expectations for students, he or she may teach in a way that is consistent with those expectations; thus, if differential expectations result in differential treatment, there is the potential for such treatment to result in differential student learning and achievement. (p. 3)

Taken together, these studies provide evidence that educators of color can significantly influence the academic trajectory of their students.

While this research supporting the importance of educators of color (especially when focused on racially congruent teacher-student pairings) may lead some to draw the conclusion that racially segregated schools are beneficial, Boser (2014) highlights that it “is important for all students to interact with people who look and act differently than they do in order to build social trust and create a wider sense of community” (p. 3). Additionally, in a recent student perception study utilizing 50,000 sixth through ninth grade student reports on 1680 classroom teachers, Cherng and Halpin (2016) concluded that students (independent of race) feel more favorable towards Latino and Black teachers than towards White teachers. This finding further supports the notion that “minority teachers can translate their experiences and identities to form rapports with students that do not share the same race or ethnicity” (Cherng & Halpin, p. 10). In sum,
this research adds significant credence to the claim that educators of color can positively impact all students.

**Educator Pipeline**

The term teacher pipeline or educator pipeline is routinely found in literature on the education workforce. Villegas and Lucas (2004) offer this term as a metaphor that traces the path of people in the teaching profession back to elementary school. They present the pipeline as elementary students who become secondary students, who become college students enrolled in teacher education programs, and who then become educators.

Often, when the educator pipeline is described, authors characterize it as “broken” (Ladson-Billings, 2005, p. 230), a “revolving door” (Ingersoll, 2002, p. 23; Lau, Dandy, & Hoffman, 2007, p. 27), or “leaky” (Butty & Brown, 1999, p. 282). Lau, Dandy, and Hoffman go so far as to describe the education workforce as a “sieve” (p. 27). Throughout the educational research literature, scholars have examined many of the points where the flow of the pipeline is interrupted (Achinstein et al., 2010; Cochran-Smith, 2004; Evans & Leonard, 2013; Haddix, 2017; Kohli, 2009; Villegas & Lucas, 2004). Ultimately, these studies converge on the same conclusion that no matter the source of the leaks or the point in time when they surface, the leaky pipeline is having a negative impact on the availability of educators of color in schools today.

In response to the detrimental consequences of a failing pipeline, Villegas and Lucas (2004) assert that:

nothing less than a comprehensive and coordinated initiative to expand the number of students of color in the pipeline and to stop the leak of human potential at the identified critical junctures will alter the demographic makeup of the teacher workforce in any significant way. (p. 83)
It is important to note that Villegas and Lucas contend that two things must happen. First, the number of people of color in the pipeline must grow. Second, the departure of educators of color from the profession must be stemmed. The first point speaks to educator preparation and recruitment, and the second to retention.

For the purposes of this study and drawing from the work of Villegas and Lucas (2004) and others, we will take the previous definition of an educator pipeline, which stops when the educator is hired, and extend it to include the retention of educators. The work of Ingersoll and May (2011) support the need to be attentive to not only the inflow of educators into the pipeline, but also to the “exit end of the pipeline” (p. 4). Additionally, while definitions of the educator pipeline extend as far back as elementary school, we will begin our examination of the pipeline with university schools of education. In short, we will consider the educator pipeline to consist of the preparation, recruitment, and professional experiences related to students and colleagues, as well as retention of educators.

**Educator preparation.** Eighty-five percent of teachers come from traditional education programs (Barth, Dillon, Hull, & Higgins, 2016). For that reason, it is essential to examine the experiences of pre-service educators of color in university schools of education. While many factors have been uncovered as reasons for the smaller-than-optimal pool of educators of color, four emerge most often: the current demographics of colleges and universities, the make-up of schools of education, barrier exams, and the curriculum in schools of education (Branch, 2001; Brown, 2005).

Both in American universities in general and their schools of education specifically, people of color are disproportionately represented. Considering that enrolling in a university is contingent upon previous educational attainment, Achinstein et al. (2010) and Aud, Fox, and
KewalRamani (2010) describe how disadvantageous earlier schooling opportunities have led to the presence of a disproportionately low number of people of color in American universities. Narrowing down to schools of education, Cochran-Smith (2004) and Evans and Leonard (2013) describe school of education demographics as overwhelmingly consisting of White females. Consequently, it is in relation to both previous educational disadvantages and the existence of large numbers of White females in schools of education that the current demographics do not work in favor of a diversified workforce of educators. Also, negatively impacting the pool of educators of color is the increasing opportunity for people of color to be employed in fields other than education. While this is a positive result of the Civil Rights Movement and desegregation (Madkins, 2011), the field of education is feeling the impact nonetheless (Wilder, 2000).

As with demographics, both in admission to universities in general and schools of education specifically, entrance requirements such as SATs/ACTs or the Praxis I exam work counter to creating a more diverse field. Nettles, Scatton, Steinberg, and Tyler (2011) examined results of the Praxis I exam, a requirement for entrance into many education programs, and found that approximately 80% of White students pass on the first try while 40% of African-American students pass on the first try. This statistic is even more disheartening when recognizing that success on a barrier exam like the Praxis I is not even a predictor for success in the field of education (Darling-Hammond, 2000). So, both barrier exams required in order to be accepted into universities and other exams required to enroll in education programs are serving to limit the number of students of color available in the workforce.

Another factor affecting the availability of educators of color in Massachusetts is the need to pass the Massachusetts Test for Educator Licensure (MTEL). An April 2008 memo from
the Acting Commissioner of the Massachusetts Department of Elementary and Secondary Education (DESE) informed the DESE Board that 77% of White test takers pass the MTEL while 46% of African-American test takers and 48% of Hispanic test takers pass the exam (http://www.doe.mass.edu/boe/docs/FY2008/0408.pdf). The memo goes on to report that these pass rates mirror what is found on the Praxis II exam. Data available on the DESE website for 2015-2016 is encouraging in that pass rates for all three racial groups have gone up, but a gap of 13 to 20 percentage points remains (http://www.doe.mass.edu/mtel/2016ResultsByCategory.html).

Brown (2014), Cochran-Smith (2004), and Montecinos (2016) contend that another factor limiting the pool of people of color in the field of education is the curriculum in university schools of education. Cochran-Smith argues that a way to fix this issue is “by incorporating their [people of color] perspectives into the curriculum and finding ways to decrease the alienation they often experience” (p. 390). Achinstein et al. (2010) conclude that programs of education that concentrated on recruiting and supporting pre-service educators of color showed higher educator retention than the teaching force as a whole.

Just as literature has focused on the factors leading to the disparity in people of color in university schools of education, research has also suggested answers to this disproportionality. While a number of possibilities have been posited, two such suggestions stand out in the frequency with which they appear. First, Schmitz, Nourse, and Ross (2012) suggest that more communication between schools of education and departments of education could help to produce college graduates in fields better aligned with disciplines most in need of educators. A second suggestion is to provide pre-service teachers with better clinical experiences so that they are more likely to remain on track to become an educator (Achinstein et al., 2010).
**Recruitment.** While teacher preparation is a vital phase of the educator pipeline, it is teacher recruitment that Barth et al. (2016) describe as “the leakiest section” (p. 11). Three reasons were offered for why this portion of the pipeline is so leaky. First, graduates of schools of education do not necessarily enter the field of education. Next, the need to pay off loans adversely impacts the ability to enter the field of education. And, a clinical experience too late in the training process can lead to a late change out of the field of education.

Because states generally do not keep data on the jobs that graduates from schools of education pursue, it has been left to the research community to attempt to quantify this data. Studies differ in their conclusions of how many graduates from university schools of education do not remain in education, but even the varying findings speak to a problem in the system. Barth et al. (2016) conclude that between 25-50% of education school graduates do not go on to teach. This high number of teacher education graduates who do not follow through and teach only exacerbates the already small number of candidates in schools of education.

While some graduates of schools of education may want to enter the field of education, Barth et al. (2016) found that the need to pay off school loans coupled with the perception that education is not a lucrative profession has led some people to choose a different field. Ladson-Billings (2005) and Shipp (1999) report that the decline of people of color in the field of education coincides with increases in fields with higher paying jobs, like law and medicine. As will be discussed later, loan forgiveness programs can be a way to counter this trend.

As noted with regard to the teacher preparation aspect of the pipeline, clinical (practicum) experiences can cause some educators of color to fail to graduate from schools of education. Torres, Santos, Peck, and Cortes (2004) examine the timing of these experiences. They conclude that clinical experiences that are scheduled toward the end of the degree program
force some students to go far down the path toward being an educator before a field experience gives them pause to reconsider. Those same students choose to graduate with a degree in education, but do not pursue a job in that field.

Recent literature proposes three successful strategies for improving recruitment of educators of color. School residencies, such as the Boston Teacher Residency Program, have been shown to increase the number of educators of color available to be placed in teaching positions (Solomon, 2009). Second, given the high cost of university education, Villegas and Davis (2007) assert that an important recruitment effort has been programs that reduce or remove college loans for people who teach for a set amount of time after college. Finally, a good amount has been written about programs that seek to interest high school and even elementary school students in the field of education, known as “grow your own” programs.

**Impact on students.** As stated previously, there is significant research on the impact that educators of color have on their students. When considering this impact, two themes emerge in the literature. The first relates to how educators of color may serve as role models to students and the second addressed how the racial and ethnic backgrounds of educators of color positively impact curriculum and learning.

The work of Atkins, Fertig, and Wilkins (2014) and Beady and Hansell (1981) explain the motivating influence that educators of color have on students of color. When students of color see all races represented in the faculty of their school, they are exposed to greater expectations for their own futures. Additionally, these authors note that the presence of educators of color positively affects the perceptions of students of color by making them feel a part of the school. This sense of student belonging results in greater student engagement and connectedness, which are important factors in a student’s ability to be successful.
Castañeda et al. (2006) conducted a study that explored the perceptions of educators of color working in diasporic rural settings in Wyoming and the inevitable challenges these educators face. Although challenges are noted, the participants’ influence as role models, to bring cultural authenticity, inspiration, and multiplicity of perspective to all students in ways that White teachers could not, serves as an example of the importance of employing educators of color.

When educators of color bring cultural authenticity, inspiration, and a multicultural perspective to the schoolhouse, racial inequities are reduced. Supporting this research, Goodwin (2004) conducted a study with seven post-secondary educators of color to explore what educators of color feel they bring to their work and the teaching profession. From this research, it was found that “teacher educators of color possess an empathic understanding of the lives of children of color, which results in a strong desire to engage in social action and redress inequities” (p. 22).

To address the inequities in educating students, Gist (2014) conducted a study that investigated the pedagogy of three socio-politically conscious teacher educators in teacher preparation programs to understand how to tailor teacher preparation for educators of color as a means to equip these teachers with the skills necessary to provide culturally responsive pedagogy to the students they will eventually teach. From this study, Gist purports that teachers of color are situated to make meaningful contributions to the teaching profession at a time when “the educational community is attempting to more precisely define aspects of effective instruction for students of color” (p. 280).

**Discipline.** The fact that Black students are suspended or excluded from schools at a remarkably higher rate than their White peers was first studied and published in 1975 by the
Children’s Defense Fund (1975). In the four decades that followed, this finding of racial disproportionality in school discipline has remained consistent (Costenbader & Markson, 1998; Glackman et al., 1978; Gregory, 1997; Gregory, Skiba, & Noguera, 2010; Skiba, Michael, Nardo, & Peterson, 2002). However, understanding the perceptions that educators of color and White educators may have regarding how race may or may not influence the school discipline system has not been studied extensively. While pre-service programs and the hiring process ultimately impact students, discipline has a direct and immediate impact. The research speaks to three components of the impact of discipline: the role of the educator, the subjectivity of the educator, and interplay between the educator and student.

The role that the educator plays in discipline speaks to the influence of educators as role models enhancing student attendance and achievement. Simply put, the presence of African-American educators increases the connection of students of color to schools (Villegas & Irvine, 2010). This connection can improve student attendance rates, and better attendance is logically linked to increased academic achievement. Therefore, educators of color play a crucial role at the start of this continuum. The work of Lindsay and Hart (2017) promotes educator diversity as a means of increasing academic achievement of Black students. In this study, Lindsay and Hart found evidence that supports a decrease in discipline and an increase in the reading scores of Black students when these students are taught by same-race teachers.

Given that discipline is meted out by human beings, it is important to consider the possible impact of subjectivity on patterns of discipline. One way to understand educators’ subjectivity is to explore their individual perceptions of expected student behavior and if those expectations are applied differently to Black students. Two themes emerge when looking at the subjectivity of discipline: subjectivity of the interpretation of behavior and subjectivity in the
assigned consequences. Skiba et al. (2002) assert that the consequences for disciplinary infractions by African-American students are subjective because an educator’s own beliefs and assumptions about Black students may influence how behavior is managed based on preconceived ideas. Skiba et al. conclude that significant discrepancies in school discipline between White and Black students indicates a systemic bias.

Interactions between students and educators are inherently complex. When educators and students come from different racial and cultural backgrounds, this complexity is enhanced and may influence the relevancy of the discipline (Gregory & Mosely, 2004). These authors refer to Culturally Relevant Discipline (CRD) as a frame through which to more critically examine student discipline. CRD posits that for an individual student’s discipline to be relevant, an educator must consider cultural and racial factors as well as previous discipline experiences in each disciplinary incident (Gregory & Mosely).

**Retention of educators of color: Evaluation and satisfaction.** Research regarding the retention of educators has been narrow because of limited data, especially at the national level (Ingersoll, 2002). In order to gain a better understanding of topics related to the experiences of teachers and principals, the NCES conducted educational surveys beginning in 1987. These surveys focused on general school conditions, including student demographics as well as hiring and retention practices (http://www.nces.org). Using the data from the NCES educational surveys, Ingersoll found that teacher retention was influenced by varying factors including retirement, school staffing decisions, personal reasons, interest in pursuing another job, and/or job dissatisfaction. The data also showed that 39% of entering teachers leave the profession within the first five years of teaching (Ingersoll). This lack of retention of teachers in the first five years was related to the aforementioned factors, with the exception of retirement.
Principal retention was more likely to be influenced by factors like school level and setting as well as student demographics and achievement, while personal characteristics such as age, race, and gender had a smaller influence on principal retention rates (Fuller & Young, 2009). After the 2011-2012 school year, 78% of principals remained at the same school while 6% of principals moved to another school, and 12% of principals left the role of principal (Goldring & Taie, 2014). DiPaolo and Tschannen-Moran (2003) found that within five years 26% of principals would retire, 11% of principals would seek central office positions, and 2% of principals planned to leave the profession. When asked about filling the anticipated vacancies, principals expressed that they believed a principalship was not a desirable position. The primary reasons given were job-related stress and hours required of the position (DiPaolo & Tschannen-Moran). National survey data like this, as well as single case studies and other independent studies, have been used to better understand the retention of educators of color.

**Retention of teachers of color.** The preparation and recruitment process does not solely limit the number of teachers of color in the educator pipeline. The disproportionality between teachers of color entering the profession and those leaving the profession also has an influence. In the beginning of the 2003-2004 school year, 47,600 teachers of color entered teaching, however, by the end of the year, 56,000 teachers of color left teaching (Ingersoll & May, 2011). Since 1988, the turnover rate of teachers of color has gradually increased. From 1988-1989 to 2008-2009, the annual turnover rate of teachers of color has grown from 15.1% to 19.3%. Attrition of teachers of color is influenced by one or more of the following factors: 32.9% of teachers of color identified leaving teaching because of retirement; 45.3% of teachers of color identified leaving teaching for personal reasons; 35.4% of teachers of color identified leaving to pursue another job; and 35.3% of teachers of color identified leaving because of job
dissatisfaction (Ingersoll & May, 2011). Only one-third of the teachers of color are leaving the profession because of retirement, while two-thirds of teachers of color are leaving their jobs because of personal reasons, to pursue another job, and/or job dissatisfaction.

**Job satisfaction of teachers of color.** Ingersoll and May (2011) found that organizational conditions, like faculty decision-making influence and teacher autonomy, have a more significant impact on job satisfaction for teachers of color than for White teachers. While administrative leadership and support, as well as salary and resources have an influence on retention rates, there is a similar significance for all teachers. Factors like student demographics, including higher rates of low socioeconomic status or population of minority students, did not influence the turnover of teachers of color (Ingersoll & May). These findings validate an earlier study completed by Ingersoll (2006) which reported that organizational conditions such as administration, accountability testing, student discipline, influence and autonomy, workplace conditions, classroom intrusions, salary and benefits, teaching assignments, and class size influence public school teachers of color, independent of school and student population. In summary, organizational conditions and administrative support contribute to the job satisfaction of teachers of color.

**Evaluation of teachers of color.** The evaluation of teachers has been impacted by legislation focused on accountability and student achievement. As a result, school districts have worked to add reforms to how teachers are observed and evaluated (Clifford & Ross, 2011; McCleary, 1979; McQuinn, 2012). A model evaluation has been defined as one that links instructional practices to student learning outcomes and ensures accountability (Phillips, Balan, & Manko, 2014). Other effective characteristics include a focus on reflective conversations with teachers, standards-based criteria, procedures for collecting multiple sets of data, detailed scoring
rubrics, and methods for assessing specific teacher behaviors (Danielson, 2010; Odden, 2004; Toch, 2008). Despite efforts to create reforms, the teacher evaluation system still has challenges linked to subjectivity and a lack of training of the building principal who in most cases is responsible for evaluating teachers (Cosner, Kimball, Barkowski, Carl, & Jones, 2014; Danielson, 2010). Consequently, the subjectivity and lack of training of principals can lead to inequities that impact the ability of teachers of color to grow and receive opportunities for leadership positions (Knaus, 2014).

Retention of administrators of color. According to the NCES, 20% of public school principals were educators of color in 2011-2012 (Hill, Ottem, & DeRoche, 2016). This represents a slight increase since the 2003-2004 school year when 18% of public school principals were educators of color. While the percentage of Black principals has not dramatically changed, the percentage of Hispanic principals has slightly increased from 3% in 1987-1988 to 7% in 2011-2012. However, the percentage of White principals has decreased from 87% to 80% during this same time period (Hill et al., 2016).

Job satisfaction of administrators of color. When studying school characteristics, White et al. (2011) identified how factors like student demographics, school climate, parent support, and school location influenced the job satisfaction of principals of color. Bitterman, Goldring, and Gray (2013) reported preliminary data gathered from public school and private school principals, with a 20% participation rate of principals of color, however, they did not control for race or ethnicity. Principals reported how their level of influence on school based experiences including setting student performance standards, establishing curriculum, determining professional development, evaluating teachers, hiring teachers, setting discipline policy and overseeing budget influenced their job satisfaction. With limited research published about the
job satisfaction of principals and administrators of color, it is evident that there is a gap in research.

*Evaluation of administrators of color.* Over the years, the responsibilities of the building administrator have become more complex. Along with ensuring student growth and achievement, the modern-day building administrator is also responsible for managing resources and maintaining a myriad of relationships inside and outside the school community (Davis & Hensley, 1999). As a result, the administrator evaluation needs to be comprehensive, equitable, and provide for reflective feedback from both the evaluator and the evaluatee (Clifford & Ross, 2011). Despite reform efforts there remains a gap in research that offers a clear and consistent theoretical framework for conducting an effective evaluation (Reeves, 2005). As a result, there is a void in research literature that examines how current evaluation systems impact the growth and development of administrators of color (Glasman & Heck, 1990; Goldring et al., 2009).

While there have been studies that identify the factors related to retention of administrators (DiPaolo & Tschannen-Moran, 2003; Papa, 2007; Whitaker, 2001), fewer studies have explored the factors that influence the retention of administrators of color. This is a gap in the research that needs to be addressed as the number of administrators of color gradually increases. Additional research will also help to identify the factors that influence the retention of administrators of color and refine practices and policies that will increase the number of administrators of color.

**Conclusion**

In this chapter, we examined the issue of the experiences of educators of color in recruitment, hiring, and retention, and identified the impact that the lack of diversity has on the
educational environment. We presented research questions that we studied as a group hoping to fill the current research gap that is connected to this issue.

The statistical data we reviewed indicate that educators of color working in U.S. public schools are greatly underrepresented. This disparity becomes more significant as the population of students within public schools becomes more diverse. To understand the impact of this phenomenon, we have reviewed literature that considers the experience of educators of color and their perceptions related to pre-service programs, recruitment and hiring, student discipline, how their race and ethnicity impact students, how they experience the evaluation process, as well as their job satisfaction and retention. Our efforts have unveiled a lack of literature that is able to provide successful strategies that offer viable and effective solutions. As a result, we constructed a study that collected data to answer the research question: How do educators of color experience racial disproportionality within the educator pipeline and schools? The counter narratives provided by educators of color gave us a unique perspective based upon their experiences.

It is our hope that the data collected from our study will help to inform further research studies and provide guidance to schools and districts who are interested in creating a more diverse staff. Chapter 2 will describe the methodology used in this study.
CHAPTER 2

METHODOLOGY AND LIMITATIONS

Methodology

All researchers for this study designed protocols and practices for collecting and analyzing data. The research team was divided into three pairs based on the relatedness of their individual research studies. Collected data contributed to the overall study’s findings while individual team members analyzed data independently as it related to their individual study. This chapter will outline the study design, shared protocols and practices for data collection and analysis, as well as the study limitations.

Study Design

The purpose of this single-site case study was to explore and understand the experiences of educators of color in light of the persisting racial disproportionality within the educator pipeline and schools in a Massachusetts district. The team employed a single-bounded case study of Cityside Public Schools (pseudonym) to explore how a sample of educators of color perceived their experiences of preservice education, recruitment and hiring experiences, the impact of their race on students and student discipline, educator evaluation processes, and job satisfaction. This case study relied on data consisting of a job satisfaction survey, Multigroup Ethnic Identity Measure (MEIM) protocol, semi-structured interviews, and document analysis. The rationale for implementing this design was to utilize different data collection forms at the same time in order to both confirm and triangulate findings, as well as enrich our collective understanding of the research problem (Creswell, 2012; Merriam & Tisdell, 2016). As the

---

2 This chapter was jointly written by the authors listed and reflects the team approach of this project: Charles J. Drane III, Diana Guzzi, Roderick V. MacNeal, Jr., Leslie M. Patterson, Nancy Robbins Taylor, and Joan M. Woodward.
research was limited to one district, the study was delineated by the time allotted for data
collection within the district, November through December of 2017, and the time allotted for
subsequent analysis, December 2017 through March 2018.

Site Selection

According to the Department of Elementary and Secondary Education (DESE), in 2016-
2017 9.7% of educators in Massachusetts were identified as non-White. For this study, research
was conducted in Cityside Public Schools (CPS), an urban district in eastern Massachusetts.
This district employs the second-largest percentage of educators of color (26%) in the
Commonwealth. More specifically, the CPS Office of Human Resources reported 22% teachers
of color teach a non-White student population of 60.1%. Site selection was also determined by
the following criteria: a hiring and retention process that focuses on increasing educator
diversity, the current employment of educators of color, and a diverse student population as
identified by and reported to DESE which included the following race(s) and/or ethnic groups:
American Indian or Alaska Native, Asian, Black or African-American, Native Hawaiian or Other
Pacific Islander, as well as Hispanic or Latino. Additionally, the site selection was ultimately
determined by Cityside’s willingness to participate in the research.

Data Collection and Analysis

Data collected for this case study was generated through recruitment emails (See
Appendices F and G), a job satisfaction survey (See Appendix H), the Multigroup Ethnic Identity
Measure (MEIM) protocol (See Appendix I), semi-structured face-to-face recorded individual
interviews (See Appendices J through M), and document analysis. Documents that were
reviewed included Cityside’s Teacher Recruitment and Hiring: Administrator Survey, [Cityside]
Hiring Committee Selection Process document, [Cityside] Public Schools Staff Diversity
Recruitment, Hiring and Retention Programs and Initiative document, DESE staff and student demographics and discipline report data, and Cityside’s collective bargaining agreements for Unit A and Unit B.

**Job satisfaction online survey.** The job satisfaction online survey designed for this study was adapted from the Teacher Follow-Up Survey (TFS) administered by the National Center of Educational Statistics (NCES, 2013). In order to assess job satisfaction, the following areas were presented to participants in a four point Likert scale survey online addressing areas which included student discipline, administrative support, decision-making participation, job stress, colleague-to-colleague relations, gender, family support systems, overall job satisfaction, as well as demographic and employment information. The online survey link was shared in the initial recruitment email to all CPS educators of color. This data was then synthesized and compared to some of the semi-structured interviews.

**Multigroup Ethnic Identity Measure.** Phinney (1992) developed the MEIM protocol used to determine how individuals identify with their ethnicity and their sense of belonging within their ethnic group. Study participants who were interviewed were asked to complete this protocol. The MEIM has been used in multiple studies and been shown to be a reliable identity tool (Roberts et al., 1999). While the MEIM is typically considered a quantitative methodology tool, the limited sample size in this case study was not large enough to complete a statistical analysis. Instead, this data was used to gain awareness of how participants identify themselves ethnically and was examined to inform the qualitative data gained from the participant interviews. The protocol was distributed to participants at the time of the interview.

**Semi-structured interviews.** The interviews, on the other hand, allowed us to explore participants’ perceptions of lived experiences within these processes. We recruited a sample of
educators of color, defined as district leaders, building leaders, teachers, and counselors.

Additionally, we recruited a sample of building and district level administrators (of different races) who are responsible for the recruiting and/or hiring process at the district level or building level in Cityside. The process of recruiting participants involved an email prepared by the research team sent by Cityside administration and networking through snowball sampling.

Through purposeful design of the interview questions for this qualitative case study, interviews produced counter narratives about the experiences of educators of color in the educational workforce. Counter narratives or counter storytelling, provided an opposing perspective to the viewpoint used by the White majority that accounts for racial inequities (Ladson-Billings, 1998). Moreover, Milner and Howard (2013) identify that “a counter-narrative provides the space for researchers to reinterpret, disrupt or interrupt pervasive discourses that may paint communities and people, particularly communities and people of color, in grim, dismal ways” (p. 542). We sought to understand and assign meaning to the reported experiences and personal reflections of the selected interviewees (Creswell, 2012). The purpose of the interviews was to understand how educators of color experience teacher preparation programs, hiring, supervision and evaluation, job satisfaction, the student discipline system, and how their race/ethnic identity impacts their work with students. This research also sought to understand how study participants experience being one of a disproportionate number of educators of color and whether it would make a difference if there were more educators of color in the district.

As a team, we developed interview protocols to be utilized for both district and building-level administrators of color, as well as faculty of color. The semi-structured nature of our protocols allowed for flexibility to respond to the interviewee with additional probing questions in the moment (Merriam & Tisdell, 2016). Prior to interviewing our subjects, the team piloted
interview questions with colleagues of color from outside the target district. The benefit of piloting the questions ensured that questions were clearly and respectfully worded and elicited relevant responses. All interview participants received the following: a letter of intent explaining the purpose of the interview, a request for signed informed consent, and a confidentiality statement (See Appendix N and O). These documents were distributed to participants electronically. All interviews were audio recorded and transcribed through Rev.com, and reviewed for accuracy by the research team.

**Interview participants.** As shown in Table 2.1, interview participants included district level administrators, building level administrators, teachers and counselors. Administrators were identified based on their role in the hiring and retention practice as well as being evaluators and providers professional development opportunities. This included building-level educators responsible for discipline. All educators were interviewed by an individual researcher or a two-person team with the opportunity for follow-up communication.
A total of 28 educators volunteered and were selected to participate in this study. As shown in Figure 2.1, there were 14 African-American or Black educators, 3 Asian or Asian-American educators, 3 Black Latino educators, 3 Hispanic or Latino educators, 2 multi-race, non-Hispanic educators, and 3 White educators.

Interview research teams. Our team was divided into pairs based on the themes of our individual research studies and we then determined the feasibility of conducting all interviews in our selected pairs. In the end, most interviews were conducted in pairs. These pairs were devised to understand educators’ of color perceptions of one of the following: 1) teacher preparation and pre-service programs coupled with the experiences of the recruitment and hiring process; 2) the influence of race/ethnicity on student discipline and its impact on students; 3) the impact of the evaluation process on educator growth and factors that influence job satisfaction and teacher retention.

On the one hand, we questioned whether our work would be enhanced by interviewing in pairs. This model allowed for one person to be the designated lead interviewer who maintains the momentum of the interview, leaving the other to take notes, review responses in line with learned information from other analyses and interviews, and suggest additional, follow-up
questions. On the other hand, we considered whether or not educators of color may be more forthcoming in a one-on-one interview. Each pair made the determination regarding the setup of the interview. Each educator of color was interviewed based on the responsibilities of their position and their relevance to the six individual studies.

The team worked to manage the interviewing partnership (Weiss, 1994) in a manner that created emotional safety and encouraged interviewees to speak about their perceptions and experiences, if any, of oppression and racism encountered in the educational system. The components of CRT provided the lens through which we framed the interview experience. The components of CRT, including the permanence of racism, counter storytelling, the critique of liberalism, and Whiteness as property, speak to the reality of racism and its acceptance as a normal part of the dominant culture (Ladson-Billings, 1998). Specifically, we hoped to provide the opportunity for interviewees to speak their counter narratives. Understanding counter narratives is critical to promoting equity in the educator workforce. Giving voice to counter narratives enhanced our understanding of the reality of educators of color. For example, we heard personal stories of how educators of color felt perceived by their colleagues that may be inconsistent with an accepted cultural norm (Milner & Howard, 2013). In addition, we used the data collected from the MEIM responses to gain awareness of how the interview participants identified themselves racially or ethnically and how they viewed their sense of belonging within their ethnic group.

**Interview analysis.** To analyze the qualitative interview data, we broke the data down into categories that answered the research questions of individual studies. The data was further coded into subcategories by themes or segments as we recorded redundancy and overlap and examined presenting themes. The process of assigning codes to the slices of data was guided
and informed by the tenets of CRT, including the permanence of racism, counter storytelling or narratives, the critique of liberalism, and Whiteness as property, which provided the conceptual framework for this study.

To assist in the analysis, four of the six researchers used the software program Dedoose to categorize and code the interview transcription data. The other two researchers utilized a more traditional manual approach to coding data. All data were reviewed for evidence of how educators of color perceived and experienced the racial disproportionality that exists in the education system.

**Document review.** The reviewed documents highlighted the processes (e.g., recruiting and hiring educators of color, evaluating these educators, or the influence of race on student discipline) experienced by selected participants. As the team analyzed district documentation, we remained aware of the strengths and weaknesses, as illustrated by Yin (2009), of such documentation. Yin defined four strengths of documentation: stability in that they are available to review repeatedly, unobtrusive in their creation, provision of exact information, and broad coverage of events over time. On the other hand, Yin defined four weaknesses of documentation: difficulty in locating, the potential for bias in selectivity, the presence of reporting bias, and limited access.

**Positionality of the Researchers**

Our six-person research team was comprised of four females (one Black and three White) and two males (one Black and one White). Positionality “reflects the position that the researcher has chosen to adopt within a given research study” (Savin-Balden & Howell Major, 2013, p. 71). The nature of qualitative research establishes the researcher as a data collection tool. It is reasonable to expect that the researcher brings his or her own beliefs, cultural background, and
experiences with them to the interview. Each researcher reflected upon the possible influence their positionality had on the interview process (Bourke, 2014). In other words, the team acknowledged that our own cultural background, personal beliefs and individual experiences might have varied from those of the individual interviewees. We remained cognizant of any potential impact these differences may have had on both the interview process and the interpretation of data.

**Limitations**

This study had several limitations. The sample size was limited to one district, therefore did not account for the variations amongst schools within Massachusetts or the United States. The data was only derived from 29 interviews, the administration of the MEIM to 24 participants, and the completion of the job satisfaction survey by 40 participants. Additionally, the positionality of our research team may have potentially affected our data collection and analysis in any instances where we were not transparent or mindful of the influence that the race of the researcher may have had on the research process. Lastly, due to constraints inherent in our doctoral program, our research was limited by the allotted time dedicated for data collection and analysis.

Variations of the methodology described within this chapter were implemented in the six individual studies which will be presented in Chapter three. Each individual study includes the research questions, conceptual framework, literature review, methodology, and findings. It concludes with recommendations for Cityside Public Schools and future researchers.
CHAPTER 3

INDIVIDUAL STUDY:

THE PERCEPTIONS OF EDUCATORS OF COLOR ABOUT DISCIPLINE AND RACE IN THE CITYSIDE DISTRICT

The overarching research in this case study examined the experiences of educators of color in Cityside, an Eastern Massachusetts school district. Within the overarching study, six individual studies addressed educator preparation and pre-service experiences; recruitment and hiring practices; educator evaluation; job satisfaction; the role of race in student discipline; and how the racial and ethnic identity of educators of color influences their work with students. Specifically, this individual study unpacked how educators of color view discipline towards students of color in Cityside.

Our team’s case study, as supported by the six individual studies, speaks to a timely national imperative. Only weeks ago, Gershenson, Hart, Lindsay & Papageorge (2017) concluded that exposure to Black teachers positively impacts black students, particularly males from lower socio-economic families and reduces high school dropout rates by 39%.

Over four decades ago, the Children’s Defense Fund (1975) drew attention to the “discipline gap” found in our nation’s schools. This gap refers to the finding that Black students in particular were suspended or excluded from schools at a significantly higher rate than their White peers. Since 1975, research repeatedly confirms that racial disproportionality in school discipline remains consistent (Costenbader & Markenson, 1998; Glackman et al., 1978; Gregory, 1997; Gregory, Skiba, & Noguera, 2010; Skiba, Michael, Nardo, & Peterson, 2002). The “school-to-prison pipeline” theory, which posits that the experiences students of color have with

3 Chapter 3 authored by Nancy Robbins Taylor
harsh school discipline increases their involvement with the Court system, necessitates that we must look to disrupt this phenomenon for individuals and communities (Lindsay & Hart, 2017), beginning with our schools. This disproportionality in school discipline is well established, but there continues to be a gap in the literature, concerning why, after more than forty years, this disparity prevails. There is even more limited research examining the relationship between educator demographics and student discipline. Roque (2010) affirmed the connection between race and discipline in schools and further suggested that this disparity is in part driven by the biases of predominately White school officials.

As the diversity of student enrollment in Massachusetts continues to grow, educators (i.e., teachers and administrators) must be attentive to these realities and guard against perpetuating this trend further into this century. While Massachusetts’ school communities are experiencing continued demographic change, a strong majority (91%) of educators hired to work with our students are White (Massachusetts Department of Elementary and Secondary Education (DESE), 2016). Only 9% percent of hires in Massachusetts include educators who identify as African American, Asian, Hispanic, Native American, Native Hawaiian, Pacific Islander and Multi-Race, Non-Hispanic (Massachusetts Department of Elementary and Secondary Education, 2016).

In a 2008-2013 longitudinal study of elementary students, Lindsay & Hart (2017) provide findings that support the importance of diversifying the workforce. They contend that when Black students are taught by same-race teachers, they are less likely to be excluded from the classroom as a form of punishment. While both Black male and female students benefit from the experience of same-race educators, the impact on male students is greater (Lindsay & Hart). Building on the work of Lindsay & Hart and others, this study explored the perceptions of
educators of color regarding race and discipline in the Cityside School District. Accordingly, the study responded to the following research questions:

1) How do educators of color perceive the role of race on the discipline system in the Cityside School District?
   a) How, if at all, do educators of color understand the presence of bias and disproportionality in the discipline system in relation to students of color?
   b) How, if at all, do educators of color use counter story telling regarding discipline issues for students of color?

Conceptual Framework and Relevant Literature

Critical Race Theory (CRT)

For this individual study, I focused on two tenets of Critical Race Theory (CRT): the permanence of racism which may explain how the disproportional discipline of Black students in a school system “appear[s] to be [a] normal” (Ladston-Billings, 1998, p. 11) outcome; and counter storytelling which “aims to cast doubt on the validity of accepted premises or myths especially those held by the majority” (Capper, 2015, p. 795).

There is limited literature that examines the beliefs and perceptions of educators of color regarding school discipline. This study sought to enhance this research by connecting these perceptions to the manner in which educators of color work with students of color and discipline issues. The notion that people create their reality by making sense of their experiences (Merriam, 2009) supports the conceptual framework for this study. Douglas, Lewis, Douglas, Scott, & Garrison-Wade (2008) posited that teachers and students alike bring assumptions into the classroom that may significantly impact the way they teach or learn. They state:
Teachers don’t think in neutral terms but according to or in terms of personal frames of references. These personal frames, biases and the like guide one’s intentions and their interpretation of presently occurring experiences, specifically what they see about Black people (p. 57).

With particular attention to the current literature on CRT, this study considered two contributing ideas: 1) the role of teacher diversity in student discipline, and 2) the role of teacher subjectivity in the discipline process.

**Role of teacher diversity.** Research supports that recruiting and retaining teachers of color to teach students of color may increase these students’ opportunities to be successful as it connects them with role models, and may result in improved school attendance (Wilder, 2000). When attendance increases so does students’ access to the learning environment, which can lead to improved academic achievement. An aligned concern related to how educators attend to race is outlined by Annamma et al. (2016), who further support the conclusion that differences between Black students and their White peers are significant with regards to discipline. Specifically, there is a discrepancy regarding the reasons for referrals and the likelihood of the referral resulting in exclusionary outcomes. This research, however, does not consider how teacher demographics may influence student discipline, which highlights the importance of the present study.

Literature that explored the racial disparities in school discipline in specific districts is limited, and data reporting is inconsistent. The process of discipline varies by district, school level, reporting mechanisms, descriptive detail and the process from referral to administrative disposition. Current studies rely on state and/or national statistics that lack descriptive detail regarding initial infractions (Skiba et al., 2011).
The work of Gregory and Mosely (2004) elicited theories from teachers regarding the underlying reasons for student discipline. This study’s data reflects the idea that teacher-participants did not consider race as a factor in discipline patterns. Some teachers attributed classroom discipline problems to adolescent development, lack of family structure, inconsistent implementation of discipline rules and low student achievement (Gregory & Mosely, 2004). Teacher responses did not consider either student or teacher race as factors in the disciplinary process. The relevance of the work of Gregory and Moseley to this study is that it offers a different way of conceptualizing student discipline. They frame “culturally relevant discipline” (CRD) to consider possible cultural and racial factors in each disciplinary incident. Moreover, CRD offers a framework to examine the influences of teachers, administrators and students on discipline. One tenet of CRD is that the discipline process for any student is multifaceted and links teacher beliefs, characteristics and previous experiences together in a single discipline incident (Gregory & Mosely, 2004).

There is undoubtedly a need to understand the influence of White educators on the success, or lack thereof, of Black students (Douglas et al., 2008). Douglas et al. (2008) focus their research on the influence of race on student achievement. The more a student is disciplined, the greater the impact on his/her opportunity to succeed. Rooted in a deficit thinking framework, the team’s study found that the application of this belief increases the likelihood of teachers making biased, subjective assumptions about Black students. They also found that Black students arrived at school with preconceived ideas about how teachers would view them (Douglas et al., 2008). Therefore, superintendents, human resource managers and screening committees overseeing the hiring of educators would benefit from both a conscious recognition of implicit
bias and an awareness of how to respond. The hiring and retention of educators of color, who may bring a level of cultural proficiency with them, help to highlight the problem.

Cherng and Halpin (2016) attest to the importance of educator diversity. In their quantitative study, they affirmed that school stakeholders need to remain committed to hiring increased numbers of minority educators, because doing so results in schools that can better serve students. When the diversity of the student and educator populations mirror one another, there is greater potential for both academic and social gains. Recruitment, however, is only one step in the process. Continued support by strong, well-informed administrators is crucial to educators’ success and retention (Cherng & Halpin, 2016).

Similar to the Cherng and Halpin’s research regarding the benefits of increasing the number of educators of color, Kohli (2009), in her qualitative research article, examines the experiences of women educators of color and suggests a similar finding. Kohli’s research data finds that, “teachers of color can empathize with their students and create strategies to effectively intervene on racism in the classroom” (p. 236).

The overarching topic addressed in this study speaks to the importance of a district’s hiring and retention of educators of color. While this section of the study speaks to the application of discipline, the notion is that hiring educators of color may influence the rate at which Black students are not excluded from the learning environment. Townsend (2000) and Ogbu (1982) both suggested that the experience of “cultural discontinuity” contributes to disproportionate discipline. Cultural discontinuity, or the lack of familiarity with the Black experience, contributes to White educators’ misunderstanding of Black students’ communications and behavior patterns. Misinterpretations of behavior, that may be a reflection of a student’s culture, could influence disciplinary consequences. Connecting the theory of
cultural discontinuity to the work of Skiba et al. (2011) indicates that teachers make judgments about Black students’ behavior and their ability to achieve that are rooted in “racially conditioned characteristics” (p. 87).

It then becomes evident that educators play a pivotal role in perpetuating this decades-long discipline phenomenon. On the other hand, increasing the diversity of educators may promote the understanding of the expression of culture by Black students. In addition to diversifying the educator workforce, Capper and Young (2015) cite the importance of diverse student demographics with equal representation in every classroom, course, and experience in the school setting. Another factor in the disproportionality in discipline referrals is educator subjectivity.

**Educator subjectivity.** Another question that arose from reviewing the research on the discipline disparity of students of color is how an educator’s perceptions about these students might influence the perpetuation of the disparity in school discipline. Consider the findings of Skiba, Michael and Nardo (2000), whereby after controlling for gender, race and socioeconomic status, the team concluded that “[i]n the absence of a plausible alternative hypothesis, it becomes likely that highly consistent statistical discrepancies in school punishment for Black and White students indicate a systematic and prevalent bias in the practice of school discipline” (p. 18-19). The work of Skiba et al. (2000) provides additional empirical research, which highlights that racism with regards to discipline continues to permeate our schools.

In a subsequent study, Skiba et al. (2002) explain *the color of discipline* by describing the concerns regarding how race can result in a differential pattern of treatment. This study analyzed discipline records for 11,001 students in one of nineteen Mid-western public middle schools, grades six through eight. Only school suspensions and expulsions during the 1994-1995 school
year were considered for this study. Through their research, they concluded that the consequences assigned to Black students were subjective. The team further concluded, however, that attempts to study why subjectivity occurs is problematic given the array of contributing variables like socioeconomic status and gender (Skiba et al., 2002). Yet, when the rate of office referrals was treated as a control, Skiba and colleagues (2002) found the discrepancy of race and gender disparity to be less significant. The inability to quantitatively determine the cause of subjectivity led the team to finally conclude that it is likely that the discrepancies in school discipline for Black and White students indicates systematic bias (Skiba et al., 2002). Skiba et al.’s findings support the notion of educators’ subjectivity in both the interpretation of student behavior and assigning consequences. Skiba and colleagues (2002) determined that Black students were disciplined for behavior that required educators’ interpretations while White students’ misbehavior was more objectively quantified. For example, they found that Black students were more likely to be referred to the office for being “disrespectful, threat[ing]” while White students received office referrals for “smoking, leaving without permission, vandalism.” In these cases, Skiba et al. (2002) maintain that systematic bias is present through the interpretation of Black students’ behaviors by educators.

A more recent study by Skiba et al. (2011) found that socioeconomic status is less significant than race in attempting to understand the reasons for continued imbalance in student discipline. The root, or initiation of the discipline process, is situated in the classroom where offending behavior automatically becomes an office discipline referral. Skiba and colleagues (2011) found that disproportionality exists at both the classroom and administrative levels and concluded that Black students were more likely to receive a referral from the classroom as well as harsher consequences for similar infractions. The results of this study demonstrate how both
teachers and administrators often perpetuate disparity in the discipline of Black students through seemingly subjective decision-making.

**Methods Overview**

The bounded system for this single site case study (Merriam, 2009) was the Cityside School District. Twenty six percent (26%) of the staff and 23% of the teachers in the Cityside District are educators of color. Cityside has a target goal of employing 30% educators of color. The student population at Cityside includes 60% students of color.

The data about the role of race in the discipline process were collected from semi-structured recorded interviews with eight educators of color from the Cityside District. Six of the educators worked in a middle school in the district. One high school educator and one elementary school educator were also included. The six middle school participants were referred by their principal. The remaining two educators responded to the research team’s email request for participation.

**Sampling**

This study was conducted in the Cityside School District, a public Massachusetts school district that employs a number of educators (e.g., teachers and/or administrators) of color that exceeds the state average of nine percent. Educators of color interviewed included an assistant principal, teachers and support staff. I identified educators of color involved in the discipline process at varying levels. Teachers typically begin the discipline process with written office referrals describing unacceptable behavior. Administrators (ie. principals and assistant principals) review and act (or not) on the referral and assign a corresponding consequence. This purposeful sampling (Creswell, 2012) assisted in uncovering trends or patterns regarding the perceptions educators of color have regarding student discipline. The racial/ethnic identities of
the educators interviewed included Latino/a, Asian American, African American, African Haitian, and African Caucasian (see Table 3.1).

*Data Collection*

I collected data by semi-structured, face-to-face, recorded interviews conducted privately with eight educators of color. Given that two researchers were assigned to each interview, we carefully considered how members were paired. The semi-structured model was chosen to ensure that each interview was flexible and allowed for additional questions and personal storytelling, adding to the richness of the counter stories (Solorzano & Yosso, 2002). Interview protocol questions were open-ended and contained probing follow-up questions. The following is a non-exhaustive sample of interview questions asked:

- Tell me about the discipline system in your district.
- How, if at all, does the administrative team review discipline cases to look for patterns or trends?
- Do you believe that your discipline policy is designed and implemented to protect all kids?
- Do you see any disparity in the rate or severity of discipline consequences assigned to students?
• Do you have any concerns about the distribution of exclusionary discipline practices in the district?

Respondents were asked to sign a consent form preceded by a formal letter about the study and how he/she was chosen to participate.

Data Analysis

The conceptual framework for this study was grounded in two tenets of Critical Race Theory (CRT). Through this lens, I analyzed data to answer my research questions. I manually organized and sorted data collected from the interviews by two tenets of CRT: 1) the permanence of racism, and 2) counter story telling. This initial analysis was done in collaboration with a colleague.

In the second phase of data coding, I read and reread the transcripts and sorted the data by my two preconceived categories from the literature: 1) the role of educator diversity in student discipline and 2) the role of educator subjectivity in student discipline. I manually color-coded data from the interviews that supported my identified codes.

For a third time, I sifted through the data without predetermining codes. I reread the transcripts again and noted, by color coding, certain words or phrases that were common throughout the interviews. For example, the words connections, connectedness, relationships, and disproportionate discipline were common and repeated throughout the interviews. This time I developed codes from the data points and organized them into categories. From these three levels of coding, three strong themes emerged about the experiences of educators of color within the discipline system: 1) the importance of educator-student relationships, 2) race as an asset in building relationships with students, 3) the District’s need for increased cultural proficiency to create a culturally relevant discipline system.
Findings

The following findings are drawn from an analysis of interviews conducted with eight educators of color employed by the Cityside School District. For the purpose of this contribution to the larger case study, the criterion used to define educators of color was limited to an employee who identifies as non-White. For example, interviewees for this study were Black, Latino and mixed race, all working in various district schools.

The data gathered throughout the interviews highlighted the perceptions of educators of color that disproportionality is evident in the discipline of Black and Brown students in the Cityside District. Their perceptions are supported by the 2016-2017 Discipline Data Report by the Department of Elementary and Secondary Education (DESE). The Cityside District serves 7,136 students of whom 1,840 (25.5%) identify as African American and 977 (13.7%) identify as Hispanic, with 2,821 (40.2%) students identifying as White. In 2016-2017, a total of 155 students were disciplined (all offenses), 102 of whom identify as African American or Latino. Only 25 out of the 155 students disciplined were White. When I examined this discipline report more closely, I noted evidence which supports the disproportionate discipline of certain students of color in the district (see Table 3.2).

The data demonstrates that while African American students make up 25.5% of the total student population, they account for 48% of the students disciplined in 2016-2017 academic year. White students represent 40.2% of the student population yet make up only 19% of students disciplined. This data raises questions about why Black students are being disciplined more than White students.

The second emergent theme speaks to how educators of color respond to the disproportionate discipline of Black and Brown students. The interview data reflects that educators of color build nurturing positive relationships with students of color and their families and use counter storytelling as a means of connection.

Interviews with educators of color in this study highlighted their perceptions about the role of race in the disproportionate discipline of Black and Brown students; the influence of school culture on student discipline, and the District’s professional development program designed to increase cultural proficiency while decreasing suspension rates. Additionally, educators of color discussed how their individual race and cultural background positively influenced their relationships with students.

In the interviews one district level educator of color addressed the parallel between the discipline referrals and the overrepresentation of Black and Brown students, particularly students with disabilities. He commented on the high number of Black and Brown students being identified as having social-emotional disabilities, which require an additional level of intensive behavioral support. This educator linked the over identification of Black males in special education, in part, to the disproportionality in student discipline. He explains:

We do see some disproportionality with African-American males regarding discipline.

We also see that in some of our special education programs and particularly behavior
based and social emotional needs of students. The reason I bring up the special education piece is because I think we sometimes see tracking with students with disabilities and so it’s kind of both.

His comments underscore the potential connection between the rate at which Black males are identified as having social emotional or behavioral disabilities and disproportional discipline that may be a manifestation of the labeled disability.

In contrast, Donna, a Haitian educator, discussed the discipline policy in her school which she believes aims to protect all students regardless of race, thereby minimizing the role of race in discipline. However, she points out the difference between the spirit of the policy and what she perceives as the day-to-day practice:

Typically, what you see in a disciplinary office or the hallway or whatever, you will see Black boys. They are the ones who are sent out. They will be in the office. That takes away from their learning. One of the things we have done, and not just for Black boys, for every kid is we don’t send them out of class. I know that in general, if you look at the statistics, if you look into research, what you see is that there is a big gap. I don’t think you need to be a scientist and go into heavy research. Even at the surface, we will show you that. It is as clear as day, but more importantly, in particular, these last couple of years, you’ve seen a shift even in our community, in our country.

Donna referenced the negative, and often racially charged, tenor of the public discourse, which from her perspective has influenced the general climate regarding discussions about race in schools.

A district level educator concludes that he perceives that the discipline policy is “attentive to the cultural differences in the student population.” Both district- and building-level
administrators agree on the intent of the discipline policy, however, based on the interviews, there may be a disconnect between the policy and the practice. A building level administrator agrees that the policy is “designed, yes. Implemented, I think not yet.” This administrator adds, “at the building level, we are working on it.”

Overall, the interview data reflect that the discipline policy in place aims to consider the cultural differences of students; however, the implementation of the policy may not reflect the intention. One teacher has a different perception. Pia, a biracial educator, believes that in her building, “there is no clear policy or support structure.” Her perception is that administrators are looking at who is removing students from classrooms rather than, “examining the precursors that are leading up to the repetitive behavior.”

Positive Cultural Influences on Educator-Student Relationships

Educators of color interviewed believe in the importance of educator-student relationships. These interviews underscored that when students of color were involved in disciplinary actions educators of color viewed their race as a valued asset in their work with students.

**Educators’ interpretations of student behavior.** Donna addresses how Cityside School District is working to modify their discipline practice by keeping students in the classroom:

What I appreciate about the way we do it here is you’re not going to come in the office and see a gazillion Black boys sitting there to go to [an administrator’s] office, which is where [students go] if they have detention. It will be during lunch [so that] we are not taking [their] time, lesson, instruction away. They are at a disadvantage when [they] are constantly out of the classroom and somewhere else not doing the learning.
It was also a perception of four educators of color interviewed that there are lower academic expectations for Black and Brown students particularly as they progress into the upper grades. For example, there is limited access to upper level (i.e., Advanced Placement) courses as evidenced by the racial composition in such classes. In addition, students who gain access may refuse enrollment. Sally, a biracial administrator, summarized the story of a Black male student who met the requirements for an upper level math course and subsequently dropped out of the course because he was the only Black student in the class. Sally shared the young man’s comments: “Yeah, you recommended me for honors math, honors English, honors social studies and I dropped out. I was the only Black kid there, and I felt uncomfortable. They looked at me like I was stupid.” While the Cityside District promotes heterogeneous enrollments, these comments indicated that traditionally common homogenous groupings may contribute to bored students and may even contribute to escalating student behavior. Sally suggests that when considering the notion of improving performance for all students, it appears to be an ideal but not a core practice throughout the District.

From a district-level perspective, one administrator describes a similar sentiment:

We want to make sure that we’re improving performance and results for all kids but having a specific focus on having that equity lens and providing for students who need the most support. And sometimes that is hard. I think that a lot of times that’s an espoused value but doesn’t necessarily get lived out in the daily actions that we take.

The District’s work around building cultural proficiency is ongoing with the goal of shifting educators’ individual behavior to more effectively teach a diverse student body, which could alter their influence in the discipline of students.
Arnie, a Latino educator, highlights that a colorblind perspective on student behavior can lead to a misinterpretation. He recalls a classroom disciplinary issue and relates it to a student’s ethnic background:

So when I talk to a student and I am trying to correct him/her, I’m usually coming to the fact that because I know where this behavior comes from. I know that we are being loud because we are loud at home and everybody is trying to talk over each other. Right now, we need to reduce that. We need to correct that right now because its not appropriate for the task we are doing.

Arnie uses his own personal experience to relate to the student and correct the behavior while at the same time understanding and honoring the student’s ethnicity and story. He developed a relationship with this student and her family because “the parents only spoke Spanish…so she [student’s mother] had my number and I was the point of contact.”

Further, Arnie avoids removing students from class and wants to take care of the issue himself and avoid getting the administration involved and prevent negative calls home. Arnie builds upon his relationships with students to manage behavior that may otherwise generate a disciplinary office referral. Arnie calls out certain behaviors (e.g., humming and drumming) that are seen as problematic in the classroom, but he argues that these behaviors may be viewed subjectively by teachers:

There is an issue with humming and drumming with their [students’] pencils or hands.

There are certain groups of students who do that and students who don’t. And our kids are getting sent out because they are drumming with their pencils or hands and I don’t know if we have looked into that as a school. Who are the students getting sent out for something that some cultures do and others do not.
Arnie’s stories illustrate how he views his ethnicity as an asset to the Cityside school community. Because of his background, Arnie is able to connect with a parent who may otherwise experience a language barrier when trying to communicate with her child’s school. He uses his understanding of the students’ culture to inform his own behavior and decisions about discipline and insulates students from the school’s discipline practice by not sending them to the office.

Educators of color in Cityside interviewed consistently placed a high priority on helping students develop a school identity that is positive and affirming. Sally noted that many of Cityside’s students have school experiences whereby they do not feel valued, recognized, supported or smart. When addressing the District’s language supporting inclusive learning environments for all students, Sally succinctly summarized her perception: “The issue that I found overwhelming was that the adults were adopting the language but not the mentality behind it.” So, if educators in general do not change their belief, they can isolate colleagues and/or students. One educator of color described feeling isolated being one of a very few educators of color in the building. She also happens to be the building disciplinarian and describes herself as the “whisperer of Black kids.” But, she is unsure of her role in resolving the larger systemic problem.

Without clear data collection and objective analysis, perception may breed subjectivity. For example, Donna took issue with other educators who claimed to be color-blind and said they treated students the same. She summarized her interaction with another educator by sharing what was said by the colleague: “I don’t see color. I am not a racist.” Donna went on to speak to the inherent bias tied into that statement: “Not seeing a child’s color may influence an educator’s response.” Gooden and O’Doherty (2015) confirm that, “teachers who believe they are colorblind, while often well intended, may also be unaware of the deficit thinking and low
expectations they hold for students of color” (p. 228). Rather, as suggested by participants in this study, educators of color consider race as an asset to their practice.

**Race as asset.** Strong relationships may help connect students of color to their schools (Theoharis, 2007). Educators who were interviewed described the positive impact of their own race on forging relationships with students as well as how they experienced the process of growing up as a person of color. Individual, personal stories also contributed to building relationships with students. Critical Race Theory (CRT) points to both the permanence of racism as well as the dominant narratives which both suggest that educators of color that were interviewed for this study share a heightened sensitivity and empathy for students of color – in this case as it relates to the discipline process. Educators of color may also interpret student behaviors differently than their colleagues in part because of their own experiential understanding of the individual cultural backgrounds of students.

Pia, a bi-racial educator, spoke to the need to understand that everyone has a story and that understanding the individual story becomes a building block for relationships with students. Not understanding a student’s story and/or cultural background could lead to missteps in how teachers interact with students. For example, Pia shared a personal experience whereby she felt insulted by a teacher: “I mean being biracial is obviously a major facet of who I am. I grew up in a place where you have people that [who] don’t think you’re from that community. Teachers touching your hair, like asking you if it is all your hair and if it is real or not.” Her personal experiences appear to influence her relationships with students of color.

Pia also shared another very personal story that she was told that she got into college because of affirmative action, not because of hard work. She summarized this experience: “Actually senior year, you start getting letters, acceptance letters, and all from great places, and
you feel proud about it. Then, you have someone who is White saying like, ‘Oh well, that is because of Affirmative Action,’ and it’s not. It’s because I worked my ass off.” Pia believes these life experiences enable her connections with students.

Similarly, Arnie, a Latino educator, and Scott, a Black staff member, see their race and the challenges they experienced growing up as helpful in building relationships with students of color. Their own experiences inform their understanding of behaviors needing attention and connecting those behaviors to the student’s culture. For example, some behaviors may include talking over adults, wearing headgear, and not using particular phrases like saying please and thank you. Some teachers could consider these behaviors disruptive in a classroom.

Pia spoke to the importance of interacting with students in other contexts – the grocery store or Target. This is one way to take time to build relationships with students when they (students) see you in a different atmosphere, out of the school. Pia notes that in Cityside, some educators of color struggle with classroom management and engagement with scholars: “Getting more Black and Brown teachers is not going to fix that (problem).”

Scott, an African American educator, provided a scenario whereby he sees his racial background as an asset in building relationships and empathizing with students:

I know how to deal with my Black scholars. I know what they are feeling. I know what they are going through at the moment because I’ve been there as a Black male. And usually I tell them what you’re going through right now, I’m going to help you find a way because I have been there.

These educators used their personal stories to develop connections with students and to demonstrate empathy. These relationships may provide a way to shield students of color from an
unequal discipline system as the educators draw from their experiences to inform and even
redirect students in a more culturally proficient way.

Sally, an administrator, spoke about her interactions with White students. While she has
certainty facilitating conversations about race with students of color, she also acknowledged
that she has to be conscious and deliberate about making sure she reaches out to White students
and also engage them in conversations about race. This administrator summed up her thoughts:
“I don’t have conversations about race as often with White students, which is something that
you’ve now got me reflecting on, like, oh, shoot. I should probably think about that more. It’s not
where your mind goes first, which is bias on my part.” Sally calls out the importance of
including White students in conversations around race and is willing to be reflective on her
practice and recognize her own personal blind spots.

Erica, a Latina high school administrator, talks about using the discipline process to make
connections with students. Erica explains:

Traditionally, you’re the disciplinarian. You deal with the tenet of discipline. While that
may be true, it’s also the opportunity to connect with kids about what is going on in their
lives – showing them how much you care about them and to show them why they should
care. I think this is the perfect job that allows you to do that and to kind of troubleshoot
problematic relationships with teachers, understand cause and effect and consequences. It
is making connections with kids to help them beyond high school.

Across the District, educators interviewed repeatedly spoke to the impact school culture
and the relationship with administrators has on the overall operation of a building. One factor
was the nature of the relationship with the principal. One educator credited her principal, who is
a person of color, for driving a positive building culture. Sally, an administrator offers: “[The]
principal inspires me every single day. He is what drives the culture. He is incredible, knowledgeable and passionate.”

Olivia, an elementary educator of color notes that she is “happy and comfortable” working in the Cityside School District. In addition, Erica, a Latina educator, lists trust and communication as factors that contribute to a positive school culture. Yet, in more than one interview, educators of color shared the perception that racism is real – on both an individual and structural level. A few educators voiced that there is a current focus on students’ cultural backgrounds aimed at informing how to build positive relationships with students. This issue is in the spotlight, but the outcomes of these efforts will likely not be realized without sustained effort. One educator’s comments summarize the shared ideas:

I wanted to be working with students one-on-one or group-based around discipline, around relationship building, making connections with them. Traditionally, you are the disciplinarian and you deal with student discipline. While that may be true, it is also the opportunity to connect with kids around what is going on in their lives, showing how much you care about them to show them why they should care. It’s just making the connections with kids.

The Need for Equity and Culturally Proficiency Discipline Practices

A second emergent theme spoke to the need for a culturally proficient discipline system. Cityside School District offers professional development to help educators better understand themselves, which is expected to lead to more informed interactions with kids. Educators of color interviewed believe that cultural proficiency work is important; it offers ongoing opportunities to examine their own experiences with race. A district level administrator explains:
And so one approach [cultural proficiency] to that is educators’ better understanding of themselves through our work with cultural proficiency to understand and sort out our own experiences with race, with socio-economic difference, with ableism. I mean all the different differences that exist and having that be the window into a better understanding of how we then interact with students on a daily basis and moment-to-moment basis.

In addition, Sally spoke specifically to the challenges about changing teachers’ beliefs and behavior concerning discipline: “One focus of the work in the District is to challenge educators to reflect on their own individual belief systems to better understand their sphere of influence.” Interviewees indicated that there is some continual support for educators to unpack and examine personal beliefs and biases and subsequently uncover where their beliefs intersect with practice. All educators interviewed stated that one role of the educator is to dispel stereotypes and provide narratives that counter those of the majority.

Donna provides a scenario gleaned from an in-house, student-generated video that gives a platform to students’ voices. She repeats one particular quote from a White student regarding the manner in which both his behavior and that of a Black student was managed in a classroom: “Well, I don’t understand how when my friend and I are goofing off and the teacher would totally ignore my part and gun for the Black kid. He’s the one who ends up in the hallway or sent somewhere else.” The video was designed to share with both teachers and administrators the perceptions students have regarding race, student behavior and educators’ responses. The administrative team then showed the student made video to staff members during a meeting. Donna stresses that this scenario is told through the eyes of a student.

Another concrete example of the District’s efforts to change the response to discipline issues is the emerging use of restorative conversations and practices whereby educators are
taught to delve into the root causes of behavior, which includes cultural sensitivity and understanding. One school began with a Developmental Design, moved into the Responsive Classroom program and is currently beginning to implement Restorative Practices. Restorative practices include the use of the restorative circles whereby the aggressor and the harmed begin a conversation about actions, reactions and consequences. Circles are facilitated by trained advisors in an effort to deepen understanding and facilitate forgiveness while balancing accountability. The name Restorative Justice, as it is known in other districts, was modified to Restorative Practices in Cityside because this school did not relish the perceived legal connotation tied to the word *justice*. No educator of color with whom I spoke shared being uncomfortable talking openly about race; however, there was a perception that open conversations about race in the District may be falling short of leading to the critical action of reducing both the discipline and opportunity gaps for Black and Brown students. A district administrator supported this perception by recognizing “that we have significant gaps in achievement between our White and Asian students and our Black and Latino students, our low-income students and our students with disabilities.”

Other educators of color shared that they were unsure if discipline data was broken down by race and frequency of referrals and examined at the building leadership level. Sally, a building level administrator, clarified:

> When disaggregating data and looking into it, we do. At the moment, we’re not logging in and populating [by race], because I want to go by how the child identifies in our system, which is flawed and wrong all the time, and I don’t want anybody making a snap judgment about [a student’s race], oh, I’m looking at you and I’m assuming that you are X,Y, Z so I’m going to put that on the form.
Throughout her interview, Pia links behavior management strategies and educator diversity to the cultural proficiency work within the District. From her perspective, hiring more educators of color may not fix a multi-layered problem:

I know what works for me because we still have Black educators in this building [who] struggle with classroom management and engagement with scholars. I think what to [take] away from it is yes, the perception [increasing the number of educators of color in the district] is important. Like having more bodies in front. But the cultural proficiency work about how we talk to kids, how we view kids, how we view ourselves is a huge component that’s missing. Because again, a lot of administrators, a lot of school committee members will say, ‘Let’s get more Black and Brown teachers and everything will be fine.’ It will not.

Pia articulates the history of systems used in the District to manage student behavior and discipline:

When I first started in the District, all teachers were required to take Developmental Design. That structure was about how to run advisories in the morning, you know, the whole “take a break” system. We had break areas, and if a student needed to be sent out of the room, they would go to the break area in a different room. Probably some form of reflection was involved. They would come back, and you were supposed to have a debrief before they reentered the classroom. Then if things escalated, you would go to the office, and administration would make a decision on what the consequence would be--whether or not that was detention, suspension or something else. Then that system was done away with. The process they wanted was restorative practices. That has to do with restorative conversations, restorative circles and getting the community involved, you
know, the impacted or harmed parties, having conversations with families. It is supposed
to be a kind of wrap-around system.

Like her colleagues, Pia shares the hesitation about calling out the need for more teachers
of color in the District because they are afraid to name racism explicitly. Similarly, (the District
administration) wants to “increase diversity,” and use “polite language” in their message. Pia
contends:

They [the District administrative team] don’t want to name it, like they say they want
more Black and Brown teachers because they don’t want to offend. So they say they want
more diversity, but that is a way to circumvent the real problem. Building diversity is not
just a quota.

Pia’s comments recognize that the solution to more equitable discipline is more complex
than just adding more staff of color. She says, “….yes, the perception [increasing the number of
educators of color in the district] is important. But the cultural proficiency work about how we
talk to kids, how we view kids, how we view ourselves is a huge component that’s missing
because a lot of administrators, a lot of school committee members will say, ‘Let’s get more
Black and Brown teachers and everything will be fine.’ It will not.” Pia’s perception is that
racial inequality is multilayered requiring all staff to commit to the cultural proficiency work and
not accept that simply by hiring more educators of color “all will be fine.”. Additionally, Pia’s
comments are supported by the work of Gooden & Doherty:

racism is like smog in the air—we all breathe it, and are affected by it, and thus continue
to maintain the system in some way, often subconsciously. Alternatively, working in
schools presents aspiring leaders with an opportunity to take decisive anti-racist action to
influence and change the dynamic within the system through building trustful
relationships (Gooden & O’Doherty, 2015, p. 229).

Examining district policies. From a district administrator’s perspective, the District is
working to understand and “identify root causes [of behavior] and try to focus on how to support
students with their ability to self-regulate their behaviors.” One overarching goal is to support
individual students. The District is also examining specific policies by reviewing the types of
consequences assigned to certain behaviors. The concern is that these consequences remove
students from instruction which impacts student learning. This administrator points to tardiness
to class as outlined in the District’s attendance policy. To address violations of the attendance
policy, the high school, with the input of student government, piloted different approaches to
manage offenses. He explains: “Sort of buying back the time [missed because of tardiness to
class] as a way of having an approach that recognizes behavior that we want corrected, but also a
path that doesn’t have a consequence that is academic in nature.”

This district administrator also underscores the importance of heterogeneous grouping:
“What has been really powerful is the ability to have classrooms that are heterogeneous (so) that
we don’t have disproportionately higher numbers or higher percentages of students with
disabilities or kids of color, low-income kids in certain classes. But there really is that balance
actually across our classrooms.” However, not all building level educators interviewed shared
this perception.

Discussion

Critical Race Theory (CRT) espouses that racism is a permanent and normalized practice
in society’s institutions including our educational systems. Research supports the
disproportionate discipline of Black students in our nation’s schools and provides alternate
practices to address this historical trend. Simson (2014) applies tenets of CRT to the understanding of the disproportionate discipline of Black students because it “argues that punitive school discipline policies serve as a tool that perpetuates, reenacts, and polices the boundaries of deeply engrained American racial hierarchies” (p. 514). Similarly, data collected from this individual study adds to Simson’s research by specifically examining the perceptions of educators of color that race plays a structural role in the student discipline system in the Cityside Public Schools.

Throughout the interviews with educators of color in the Cityside Public School District the data illustrated how these educators leveraged their race to build supportive relationships with students and to mediate disciplinary actions. They shared their personal experiences with both institutional and personalized racism and how they used those experiences to connect with their students. This finding is supported by the work of Kohli (2009) who found that teachers of color are able to “empathize” with students of color and intervene on their behalf with issues of racism in the classroom. I found that educators of color acknowledge that their racial background serves as an asset in building relationships with students of color. They also had personal experiences with racism in either (or both) the legal and educational systems that provided them with an understanding of students of color. It was clear to me that educators of color leveraged their own race and experiences to build these powerful yet informal relationships with students. Additionally, educators of color shared counter narratives or storytelling with students that served to further validate students’ experiences. The importance of educator-student relationships is supported by the work of Sheets (1996) when she refers to students as “concentrate[ing] on open communication and better interpersonal relationships” with teachers. Working to formalize these relationships could support the District’s work by creating a model
for educators and allowing educators to tap into such a resource. Along with educator-student relationships, expanding affinity groups for students may provide additional support. Personal stories collected in this study highlighted that educators of color recognize how their experiences influence both their professional practices as educators and how they provide strong and influential role models for the students.

Educators of color at Cityside indicated that they are satisfied with their work environment yet they also highlighted the need to look more closely at how student race may impact discipline. These educators were very clear that they do not operate out of a colorblind mentality. They want to confront the issue of race in their district and they are supported by their administrative team. Educators of color shared examples of specific student behavior and how educator subjectivity may influence the interpretation of this behavior resulting in disciplinary actions. The work of Skiba and colleagues (2011) similarly found that both teachers and administrators are subjective in both the interpretation of student behavior as well as the severity of the assigned consequences.

When asked specifically about their perceptions of how equitable the discipline policy is in their district, educators of color at Cityside provided one clear and consistent perception. This perception was that the policy is aimed to protect all students as written but the implementation of the policy demonstrates inequities. Further, educators of color shared that they were unclear about how or if discipline referrals were tracked thereby adding to confusion. One building level educator shared an opinion:

I would say at the school level, we are working on it [discipline policies]. We are definitely aware and want to be reflective of those differences. I think for the policy to be
reflective and responsive to [student] differences and for people [educators] enforcing the policy to be reflective are two different things.

Considering all facets of the research on disproportionate discipline and suggested remedies, one important action already underway in the Cityside Public School District is to increase the number of educators of color. Educators of color interviewed for this study added that simply meeting a quota will not fix the problem at Cityside. One educator stressed that all educators must become culturally proficient along with increasing the number of educators of color.

Cityside is committed to increasing cultural proficiency throughout the district. While the implementation of professional development and culturally proficient practice may look different amongst the school buildings, it is clear to this researcher that Cityside has a dedicated goal of increasing cultural diversity district-wide. In one building, staff trained in culturally proficient practices facilitates a weekly meeting centered around the work of Mica Pollock’s book *School Talk: Rethinking What We Say About and To Students Every Day* (2015). The purpose of these focus groups is to better understand diversity. Culturally proficient practices are incorporated in the District’s discipline system through the use of Restorative Justice. As Simson (2014) notes, Restorative Justice is a process focused on “reintegration, dialogue, collaboration, and mutual respect (p. 506)...which can provide a forum for minority voices to show that systemic inequalities remain a reality in American society (p. 557). While Cityside is making an effort to use restorative practices, there may be some structural barriers presented by scheduling and teacher availability that impede their ability to run restorative circles effectively.

From my research, I would argue that hiring additional educators of color, shaping culturally responsive professional development around focused conversations on race, and
implementing Restorative Justice with fidelity are all part of the process needed to begin to dismantle the institutional racism that CRT argues is perpetuated by our current educational system.

**Commendations**

Educators interviewed for this study expressed the District’s commitment to cultural proficiency. And while it is clearly happening in some schools it is difficult to assess how other school buildings are participating. One school has weekly meetings to discuss cultural proficiency led by trained staff members and aligned with the work of Mica Pollock (2015).

Cityside should be commended for its commitment to increasing the diversity in their staff by attempting to reach 30% of educators of color. Educators interviewed for this study relay that they are supported by their administrative team in their work towards cultural proficiency and that this support results in a more positive teaching and learning environment. Cityside should be viewed and respected for being at the forefront of this work and as a model to other districts.

**Recommendations**

Most importantly, it is recommended that building leaders acknowledge the important resource that educators of color bring to the District. By virtue of their race and cultural experiences, educators of color have provided strong and influential role models for students. The relationships educators of color build with students is a resource that should be tapped and when possible replicated. Encouraging the formal development of these relationships is highly recommended for both the wellbeing of students and staff.

The lack of clarity around the process of reporting disciplinary infractions and the understanding of the District’s discipline policy is an area needing growth. Cityside is
encouraged to design a system of reporting that tracks student race, nature of offenses and assigned consequences. Using such a system with fidelity would then allow the District to disaggregate the data by the same data points of race, nature of offenses, and consequences and help to define the disproportionality in their discipline which may then signal for change in the discipline structure. This process would include a thorough review of policies related to discipline and how those policies may perpetuate disproportional discipline. Further, it is recommended that Cityside engage a local university and participate in an Equity Audit. Such an audit would allow a third party to dig into the District’s data concerning discipline and help to design an action plan.

Developing a discipline system that is responsive to the cultural differences of the Cityside student population and implemented across the district consistently is highly recommended. The brief, *Culturally Responsive Classroom Management Strategies*, (Metropolitan Center for Urban Education, 2008), outlines five elements of CRCM that could inform Cityside’s discipline policy and implementation. The five elements include, 1) “Recognition of One’s Own Cultural Lens and Biases; 2) Knowledge of Students’ Cultural Backgrounds; 3) Awareness of the Broader, Social, Economic and Political Context; 4) Ability and Willingness to Use Culturally Appropriate Management Strategies; and 5) Commitment to Building Caring Classroom Communities.” This model would complement the district’s work on cultural proficiency and help to sharpen their focus on school discipline.

Additionally, it is recommended that within the framework of cultural proficiency, that the leadership of Cityside begin to craft a clear message that addresses the need for explicit discourse on race. From the interview data collected for this study, many educators are ready
and willing to bring such conversations to the building level in an attempt to create a more understanding and culturally relevant culture for students.

**Limitations**

Recognizing the limitations of this research is important. This study was conducted in one site with a relatively small sample size (eight educators of color) and therefore the findings may not be appropriately generalized to all school districts across Massachusetts. With that in mind, educators of color in the Cityside District shared powerful perceptions that race continues to be a factor in student discipline thereby warranting further research in this area. In addition, this study demonstrated the powerful influence that educators of color have on students with whom they build strong positive relationships.
CHAPTER 44
DISCUSSION AND RECOMMENDATIONS

The purpose of this qualitative case study was to capture the perceptions of educators of color related to racial disproportionality and its impact on schools. More specifically, we sought to answer the research question: How do educators of color experience racial disproportionality within the educator pipeline and schools? We defined the educator pipeline to include the preparation, recruitment, and professional experiences related to students and colleagues, as well as retention of educators. Because race served as a common thread that tied each of the individual studies together, Critical Race Theory (CRT) was utilized as a framework to analyze the data collected from a job satisfaction survey, the Multigroup Ethnic Identity Measure (MEIM), semi-structured interviews, and a document review. The basic principle of CRT espouses that racism has become a normalized practice within our society (Ladson-Billings & Tate, 1995).

In the following sections, information will be presented regarding district context that is relevant to this study followed by common themes that emerged from the individual findings. The chapter will conclude with recommendations of practice for Cityside district administrators and areas for future research. To protect the identity of each one of the participants, a pseudonym has been given to replace their actual name and when necessary their role and the level of school has not been identified.

District Context

---

4 This chapter was jointly written by the authors listed and reflects the team approach of this project: Charles J. Drane III, Diana Guzzi, Roderick V. MacNeal, Jr., Leslie M. Patterson, Nancy Robbins Taylor, and Joan M. Woodward.
Cityside Public Schools is one of the leading school districts in Massachusetts for staff diversity, with 26% staff and 22% teachers of color (Cityside Public Schools, Office of Human Resources, 2017). Yet, the district is striving to do even better in this area. To this end, Cityside Public Schools’ district level administrators are devoting significant resources to realizing this goal. Specifically, established in the FY18 budget is a new initiative related to increasing educator diversity as well as a new district level position, both designed to actively address racial disproportionality, or the “student-teacher diversity gap” (Cityside Public Schools, Office of Human Resources in Cityside Public Schools. The primary goal of the diversity initiative is to highlight that increasing the number of educators of color in the district is a matter of urgency, and to ensure that efforts in this area are supported by “diversity, inclusion, and equity programs and initiatives” (Cityside Public Schools, Office of Human Resources) across the district. The new district level position is in place to focus explicitly on diversity recruitment. It should be noted that several study participants expressed excitement for the creation of this new role.

Additionally, Cityside administrators at the district and building level are facilitating professional development experiences with a cultural proficiency focus. For example, administrators are discussing the content of Mica Pollock’s book Schooltalk (2017) at their monthly administrative council meetings, and this book is also being used by one of Cityside’s principals as a basis of discussion with his staff. Another principal offered an optional course for the educators in her building that examined racial bias, while yet another principal is leading his staff through a discussion of Glenn Singleton’s Courageous Conversations About Race (2015).

**Discussion**

In examining the findings from each of the individual studies, three significant themes emerged: race as an asset, the permanence of racism, and the connections that educators of color have established with the Cityside Public School District. The themes were determined as a
result of each researcher presenting the findings from their individual study during a group discussion. This lead to an analysis of data that focused on finding common themes that resonated in each of the six studies. The themes are presented in each of the headings in the following section. Although the CRT tenet permanence of racism serves as a heading, it was also utilized to explain how the construct of race was considered in each of the aforementioned three themes. In addition, the CRT tenets of counter storytelling, whiteness as property, and critique of liberalism were also used to explain how the construct of race was considered in each one of the themes.

**Race as an Asset**

Educators of color in CPS view their race as beneficial in a number of ways. Specifically, these benefits positively impact their relationships with students and with adults. Related to the students, educators of color often mentioned being a role model to them in various ways and they highlighted their culturally responsive approach to student discipline. And, with fellow educators, race was significant in mentoring, professional networks, and the evaluation process. The following sections will present in more detail how educators of color experienced the assets of their race.

**Race as an asset in relationships with students.**

*Role model for students.* Educators of color made numerous comments related to being a role model for students. When analyzed, these comments were grouped as follows: the sense of satisfaction in being a role model; the importance of students seeing people like them (or not like them); and, providing career-related examples for students.

*Satisfaction.* In hearing counter narratives of the educators of color who were interviewed, it was clear that there was a true sense of satisfaction in being an educator who was
also a person of color. Connie, an African-American teacher, stated this well when she said, “I think it does the students a good service, in that they’re seeing educators of color standing before them. That is gratifying to me.” It was Connie’s sense of pride to be standing before students of color, not only as a teacher of color, but also as a role model and exemplar for her students of color that was notable. Connie’s experience of being a role model for students of color is an example of how Black teachers serve as needed role models for Black students as well as non-Black students (Graham, 1987). Other teachers similarly used the words “wonderful,” “happy,” and “empowering” when they talked about the satisfaction they gained from being role models to their students.

_The importance of students seeing people like them (or not like them)._ Of the 25 educators of color interviewed, almost all participants used the phrase, “someone who looks like me” at some point during their interview. The value that the educators of color placed on students of color seeing them was unquestioned. What was also expressed by some was the value that all students gain from seeing people of color as their teachers. As discussed in Chapter 1, the work of Stewart et al. (1989) and Egalite et al. (2015) support the concept of the positive influence of same-race role models.

When interviewing about pre-service experiences, Sonya, a Black Latina teacher, even discussed the importance of seeing people who looked like her with regard to her experience as a person of color in her graduate program. She said, “I knew the people in the food service staff at [university name omitted] because they were the only people that looked like me.” Her awareness of her connection to them is just what the educators of color reported about their presence in Cityside. Succinctly, Pia, a biracial teacher, asserted: “I’m sure for some of them it’s wonderful to see a teacher that looks like them in front of them.”
Carlos, a Black teacher, made the point that is well supported in research by Irvine (1988) and Branch (2001) that it is not only students of color who benefit from an educator of color in front of them, but it is all students who benefit: “I’m happy to be a role model for students of color. I’m happy to be a role model for all students.” Another study participant shared, “I have to be conscious of reaching out to White students in the school … because if not, they just think of me as the teacher that just services [students of color].” An administrator of color shared how students were interested in learning more about him after meeting with a group of students in an organized after school program. “It was interesting having the conversation. They were very interested in my background and what brought me to this position.”

*Providing career-related examples for students.* Taking their impact a step further, the educators of color who were interviewed also talked about their presence being one that could eventually lead their students into the field of education (or other fields). In terms of the impact of educators of color in the classroom, Pia expressed the perception that students have not seen many educators of color in that profession, so her presence was especially important:

For students that have primarily seen people of color … predominantly as assistants, or support staff … to see teachers in a lead role that are of color sends an empowering message - that we’re leaders. … It’s all about perception. So, … when what you see, especially in your formative years, is people of color always in a subservient or an assistant role, you can’t help but create this notion that, ‘Oh, White people know what they’re talking about,’ or, ‘Black people, you always see them deferring to the White leaders in the classroom.’ You know? It sends a really harmful message.

More simply, Fernando, a Black educator, describes a similar feeling: “I’m here to show these kids … there are different kinds of teachers.” Furthermore, Carlos believes that as a teacher of
color he models to students of color that they can aspire to be professionals: “It possibly will
give students of color the feeling [that] they can be in a role such as a teacher or another positive
career choice that they may not see daily, especially if the person in front of them does not look
like them.” So, the impact of educators of color is not just to present an image, but to also
present an aspiration.

*Culturally responsive discipline.* Cityside Public School educators of color suggested
that their educator-student relationship impacts school discipline. Findings revealed that some
educators of color may be better suited to interpret certain student behaviors as an expression of
one’s culture rather than as an example of misbehavior. Scott, an African-American male
educator, uses his racial background and experience to empathize with Black male students, “I
know how to deal with my Black scholars. I know how they are feeling because I have been
there as a Black male.” As a result of this cultural understanding, educators of color may be
better able to establish positive relationships with students of color. Moreover, there was a
perception that these established relationships underscore a commitment by educators of color to
create and maintain a school culture that is positive and affirming. The nature of the educator-
student relationship may be highlighted in the use of newly adopted discipline practices, such as
restorative justice. The process of restorative justice considers the “reintegration, dialogue,
collaboration and mutual respect” in managing discipline issues (Simson, 2014). Additionally,
Simson argues that restorative justice aligns with the principles of CRT and is more “conducive
to creating nurturing, safe and inclusive school environments.”

Taken together, the educators of color who were interviewed described many ways in
which their race was an asset in their dealings with students. From being a professional to whom
to aspire, to representing a supportive, familiar face to students during the discipline process, the
educators of color were certain of their impact. It was evident that these educators gained satisfaction from being such an important figure to their students.

**Race as an asset in relationships with adults.**

*Social networks.* Networks among educators of color appeared to play a significant and positive role in helping educators of color find jobs in Cityside. Several study participants discussed how their direct and indirect connections with teachers and administrators from CPS helped them develop a social network that they utilized during the recruitment and hiring process. Angelica, Donna, and Paula shared how they used their connections and social networking to look for new jobs when they were leaving their former districts. Angelica, an African-American teacher, described how she relied on networking with educators of color when she needed to find a new job:

> A friend of mine who happened to know our [current] assistant principal, mentioned to her that she knew me, [a teacher] looking [to transfer to another] school. Then we connected, and I submitted my application and interviewed, and I'm here.

When Donna, a Black educator, needed to part ways with a school system she had been in for three years, she recalled Fred, an educator of color with whom she had connected during a professional development training at the start of her time in the district. Since that time, Fred had moved on to a principalship in Cityside. Donna explained:

> I called Fred and nothing in life happens by chance. It just so happened he was looking for a [licensed practitioner]. I literally ran here with the phone while talking. It's like you start working with someone, and you feel like you could have run and then it ended. When I got the opportunity, I just couldn't believe it. That's how I ended up here, working here.
Paula, an African-American teacher, learned of her current job through her landlords, who happened to be the aunt and uncle of her current school leader who also identifies as African-American. Paula shared:

So actually, when my first husband moved here we lived in an apartment that belonged to Halle’s [current principal’s] aunt and uncle. And the landlord was like, "Oh, my niece is going to try to be a principal at the school," because she was at [name of school] . . . “So she's looking for teachers." So I interviewed here and took the teacher's test the same month, I think the same day or the same weekend. And that's how I got the job here.

Paula’s story, as well as the stories of Angelica and Donna, clearly illustrate the power of personal connections in support of career advancement. Their experiences support the work of Lin, Ensel, and Vaughn (1981) who found that job seekers’ use of weak ties can impact their ability to connect with an insider contact of high status, who in the case of this study is a Cityside building principal. Also, their hiring scenarios support the findings of Mouw (2002) who countered previous researchers’ claims that Black workers are disadvantaged when they rely on informal networks to find a job.

Additionally, Cityside administrators shared perspectives that supported these educators’ of color positive networking experiences. For example, Cooper, a Black administrator, explained how he maintains relationships to utilize during the hiring process:

I am also one who spends a lot of time informally connecting with folks at churches, community groups, and I will try to maintain relationships with educators at schools across the state. And my feelings about this are that the recruitment is not just about we have a position that’s opening [so] let’s go out and find someone, but more about
managing relationships and having open communication with folks. … So I have not done job fairs. Primarily, it’s really been informal networks and word of mouth.

While Andrea, an African-American administrator, also shared how she utilized the connections and social networks of teachers in the building during the recruitment and hiring process, “being able to bring in [to Cityside Public Schools] some additional Black male educators was super, [and this] . . . expanded networks because they brought their own networks of people.” Thus, both Andrea and Cooper gave a nod to the reality and effectiveness of same-race social networks (Green, Tigges, & Diaz, 1999; Stainback, 2008), as had Paula, Angelica, and Donna.

Mentors. Another way that educators of color experienced their race as an asset was through informal and formal mentoring. One teacher of color highlighted the support she received from her “aunties,” who were other Black teachers who were supportive and embraced her. Olivia, an African-American teacher, shared:

I had so many people that took me under their wing, like just old-school teachers. They got me involved in the union. They would say, “Look, you’ve got to do this. You can’t be late to the meeting because you’re the only black person on staff. They’re going to notice you’re not there.

Olivia also explained how her relationship with an administrator prompted her to get her Master’s degree:

I had an administrator, she was African-American, and she said look what you are doing here, you’re a single mother, you have three kids. They were all under four, and she said ‘look, you have got to go get your Master’s. She talked to me differently, she was the one who really broke it down, this is what you need to do to stay in the job.’ And that
really helped. She would push me, she kept pushing. And I feel a lot of educators of color do not get that.

Olivia noted that colleague connections were not limited to only teachers of color, “You’ve got to find someone you trust, whether a person is Black, White, or whatever, and tell them what’s going on with you so you can get support.”

Evaluator/educator relationships. Race positively impacted how educators of color experienced the evaluation process in CPS. Connie shared how her current evaluator, who is a person of color, is familiar with the culture of the district and is someone who understands her role as a teacher:

Most recently, I feel personally, for the evaluator that I have currently, it’s been a fair evaluation. …She understands the population which I’m serving. When she comes in, it is non-judgmental, because she was in the teaching field for quite a long time right here in Cityside, so I think that makes a great difference.

While Craig, a Black Latino teacher, emphasized how he benefited from both African-American mentors and his current evaluator in helping him to understand the evaluation process, “…basically Black colleagues helped me. And also, my evaluator is straightforward. … He’s very black and white, says, ‘this is what I want.’ He outlines everything and does it.”

Additionally Walter, a Black African-American administrator, spoke to how he valued the relationship he has with his supervisor, which impacts how he experiences the evaluation process:

I think that she is culturally competent, and that she does a great deal to make sure she gets to know the individuals she works with, and I think that she’s done that with me, so that I feel very, very comfortable being vulnerable and honest.
Permanence of Racism

Along with experiences in which participants viewed their race as an asset, they also cited examples in which they felt the symptoms of racism while serving in their respective roles. Based upon the definition of permanence of racism, the experiences shared by participants can be attributed to implicit bias and/or overt acts of racism. Despite the distinction of how racism is manifested, the impact on each one of the participants reinforces the notion that racism is a normal part of our society (Ladson-Billings, 1998; López, 2003). Specific factors that contributed to the perceptions of each one of the participants include feelings of isolation, disrespect stemming from microaggressions, and a feeling of having to work harder than their White peers. Within this section, the aforementioned themes are discussed with regard to how they were revealed in various parts of the educator pipeline and schools within Cityside.

Isolation. In answering the overarching research question for our group study, we found it was not uncommon for study participants to feel isolated and disrespected because of their status as a racial minority, an example of where the CRT tenet of permanence of racism intersects Whiteness as property. Several teachers of color, when reflecting on their experiences in Cityside schools gave vivid descriptions on what it felt like to be one of the only people of color in their working environment. Olivia stated: “Sometimes you can feel so alone.” An Asian educator commented, “I do wish that I saw more Asian people on staff, though. I think it feels more comforting to see more people that look like me.” Also, the feeling of aloneness came from a lack of positive contact and genuine support from colleagues. Reflecting on her first job [within CPS], Olivia, recalled: “My first job was at the [school name], which no longer exists. I was the only Black teacher there for years, and I was the youngest, and there was no
mentoring.” Olivia’s experience of being left to fend for herself was echoed by several others as they also addressed the stress they experienced as members of a majority White school staff.

The feeling of isolation also impacted whether or not educators of color asked for assistance. Craig shared that he was hesitant to ask colleagues for help with the evaluation process because he did not want to appear incompetent as one of the only African-American teachers in his setting. He described his feelings by stating:

… It’s pretty much trial and error, and it’s kind of that time, it’s that thing where you’re going in blindly and people are kind of second guessing. So only imagine if you’re a teacher of color, or you’re a Black teacher and you’re the only Black teacher in the whole school, you don’t want to show others that you’re incompetent. So, it’s kind of the type of thing like you want to ask but you really don’t want to ask. Is that what is expected from me, and I’m supposed to know this as a professional? Because if you don’t want to look as if like … you don’t know what you’re doing as a professional.

Pre-service. Sonya shared that she did not feel connected to the students in her college program, “I will say I think it was very difficult for me to adjust … I felt very disconnected.” The feeling she expresses is supported in the work of Souto-Manning and Cheruvu (2016) who interviewed four teacher education candidates of color at predominantly White institutions on multiple occasions. They illuminated the need for school leaders to consider the belonging that people of color feel within their universities and specifically the schools of education. They report that people of color in schools of education experience a feeling of exclusion in all aspects of their schooling, from class discussions to student-teaching placement. The value placed on Whiteness within an educational institution (the CRT tenet of Whiteness as property) is collateral that cannot be underestimated (Brown, 2014).
For Sonya, the lack of connection to her classmates made the relationships to her professors very important:

I feel like … they looked out for me. I was identified as a student that was struggling to meet the timelines, passing in my assignments. I had a lot of issues just like with my management. But I really do think that they were very accommodating. So yeah, I feel like I was very supported...by the staff.

Further, it was the guidance of an undergraduate professor who helped Sonya navigate the steps necessary to enroll in a graduate program. She commented specifically how “connections with my professors … help[ed] me with the application process.”

Diego, a Black teacher, had a stronger sense of belonging at the same university that Sonya attended because of the cohort-based program in which he was enrolled, yet he still recognized his minority status. He shared that he felt “very optimistic. Very hopeful. I wasn’t unaware of being part of the lowest demographic.” Therefore, Diego now strives to ensure that as a Black educator he can create “that belonging, not only for the students, but also for the adults” with whom he works.

**Disrespect/microaggressions.** Furthermore, the feeling of aloneness by Cityside educators of color could be attributed to negative interactions they had with families and colleagues that were, in essence, racial microaggressions. This counter narrative told by an Asian-American educator vividly illustrates a racial microaggression that the educator encountered and it captures, in full, elements of what several other interviewees experienced while in Cityside:

I think for some of our White parents, our more entitled parents, it’s usually pretty shocking for them to meet me. That’s just par for the course for me now. … I’ll still get
the, oh you’re the [educator] or even if I’ve been emailing with that parent, they see my title, I had a parent see me, they kind of did a double-take and they weren’t sure who I was. I walked them to my office, they stopped and looked at the name card outside, but still had to ask twice what is your position again? Asked me how long have I been here? Where did I go to school? I get that a lot. I get that a lot which has been incredibly frustrating.

Angelica refers to a time when her White evaluator, exhibited low expectations for the students of color that she is responsible for teaching. To support her belief, Angelica gives an example of a goal she set to raise the writing growth of her boys of color on an IEP to 75% on the two major essays for the year. She states that her evaluator balked at the idea by stating, “Don’t you think that is a lofty goal?” Her evaluator further stated that, “… It’s ok if you do not reach everyone, it’s not a reflection upon you." This statement left Angelica to wonder:

Do I tell her… 75, a C on a paper is a lofty goal for Black boys? Why isn’t your response, ‘What are you going to do to get there?’ What is the plan?’ But your first reaction was, “Oh, that seems kind of high. It’s okay that we don’t reach them. She further discussed how someone should have a conversation with her evaluator about her implicit bias and how it is impacting her expectations about students of color.

Examples of racial microaggressions surfaced throughout the counter narratives that came to light in all six of the individual studies. These microaggressions, defined by Sue et al. (2007) as “brief, everyday exchanges that send denigrating messages to people of color because they belong to a racial minority group” (p. 273), are examples of how the CRT tenet of permanence of racism is exemplified in the day-to-day experiences of these educators of color.
Work harder. Two educators of color made specific note of their belief that they needed to work harder than their White colleagues. Whether it was the need for particular attention to detail or a feeling that they represented their race in whatever they did, the need to present themselves in a certain way based upon their race was on their mind. It is this type of thought process that underscores how the permanence of racism and implicit bias can result in educators of color believing that they have to overcompensate when they work in an environment in which they are underrepresented.

Olivia described her early experience as an educator in Cityside this way: “I just always felt the expectations were higher for me, in terms of me being able to be successful, … because I started teaching at a time when I was expected to sink or swim.” She went on to talk about how she sees the need to attend to every detail:

I’ve always felt that I had to work harder than everyone else. I’ve always felt that I had to watch my back, that I had to make sure that I crossed my T’s and dotted my I’s. So I’ve always, always kept my paper trail. I never ignore anything in writing, positive or negative.

Other educators who were interviewed also expressed a clear sense that their actions were perceived as ones that represent their race. For example, Angelica made this point when she said:

I think everything I do has to be purposeful. It feels like it has to be purposeful and calculated because whether I choose to admit it or not, or others choose to admit it or not, I make moves on behalf of my race, and what I do and my ability to do my job I think impacts another person’s ability to come into the school and continue the work that I
started or others have started. So it just feels … a bit like I come in and there is a load I carry and I have to be careful in things that I do, in everything that I do.

Olivia echoed Angelica’s thoughts in talking about her drive for perfection based upon her race:

I had to be better than everyone else. I can’t make the same mistakes everybody else makes, because I will get called on it more than other people would. … And I feel that I have to go above and beyond to show that I’m compassionate and I have higher expectations and that I’m a professional.

Finally, Angelica articulated well a dilemma she acknowledges regarding the source of her struggles:

As a Black educator, it’s hard to draw a line between the struggles I face because teachers have struggle[s] … or is it a struggle I face because [I am] a black woman [and] … there’s an additional role I’m expected to play or there’s an additional step I need to take to prove my competence … that my colleagues who are not of color don’t have to go through, hoops that they don’t have to jump through to get the same things done.

These narratives shared by participants in this section build off biases related to actions of people who are not White, accentuating the value our society places on Whiteness and the negative impact of the permanence of racism in the form of racial stereotyping (Harris, 1993; López, 2003). What Olivia and Angelica describe points to the dominant image of a successful teacher. Simply put, it is one who can navigate a system where Whiteness is capital.

Overall, the two themes described in the aforementioned sections reveal how educators of color who work in Cityside perceive their race as an asset and how the symptoms of racism impact their daily experiences. District administrators can use these findings to emphasize the importance of building social networks for educators for recruiting and combating the feeling of
isolation. Other efforts should include that exploration of how the presence of microaggressions, and implicit and explicit bias can hinder efforts to create an environment in which access and equity is the priority.

**Connectedness to District**

The narratives of educators of color who were interviewed shared how the school community and culture impacted their experience as educators of color in CPS (Ladson-Billings, 1998). When providing details about working in the district, administrators and teachers gave specific reasons as to why they prefer working in Cityside. The reasons included the diversity of the student population, same-race administrative support, feeling a sense of belonging, level of compensation, and access to resources.

For example, Carla, an Asian teacher, noted that she values working for CPS and linked this sentiment to a sense of belonging as a result of the diverse student population:

I do feel like I belong here more than other school districts that I’ve been in. I’ve been at [neighboring school district] and [neighboring school district]. I think this school is really diverse. It’s one of the most diverse schools in the nation, and I do feel like I connect with the students more than I do with a majority White high school. I’m not sure why that is. I think it’s myself, not being from here, I can relate to a lot of that . . . I think Cityside is a really good district. The pay is good. I student taught here. I think the biggest thing was that I did feel like I belonged here in a certain way, more so than I did at other schools. The diversity definitely played a role. It was probably the biggest factor to be honest.

Participants also valued the connections created with their administrators. Paula stated that sharing the same cultural background with both of her administrators influenced her decision
Paula’s response confirms findings from a study conducted by Ingersoll (2006) which lists administrative support as a contributing factor to job satisfaction. Sharing the same cultural background as her two administrators influences Paula’s decision to stay in her present school. She noted that it also helped to alleviate the stress of the evaluation process.

Additionally, Craig shared his experience with his administration. He stated, “So I met the principal and the vice-principal, and then I just had that feeling. I had that connection, like, oh, this is such a good district.” Ma and MacMillan (1999) found that teachers who believed they had a strong relationship with school administrators also had a higher job satisfaction.

It was not just teachers who felt a sense of belonging or connection with the district, administrators also spoke about the support and opportunities that Cityside has been able to provide. For instance, Cooper focused on the vast amount of resources available in Cityside as one of the main reasons for his preference:

I think in terms of educators in general, for Cityside district, I think it’s the notion of this district being resource rich. The fact that folks have opportunities to receive so many supports and I think there is this attraction to, particularly for folks who still want to have that urban experience of being able to say, ‘Hey, I’m in an urban or semi-urban environment, but not at a place in which there’s a lack of access to resources in terms of professional development, technology, and all of that stuff.’

While Erica, an Hispanic administrator, focused on the manner in which she felt accepted and valued based upon her ethnicity and her bilingualism:
Here in Cityside, I’m still the only administrator that can speak Spanish and make that phone call, but I’m surrounded by administrators [and] evaluators that understand the strength in that - that kind of asset of being bicultural. [I appreciate] working in a district where it’s not that it’s an expectation, but it’s a real value and norm. … It kind of normalizes who I am.

Erica concluded, “Here in Cityside ... I'm not negatively affected in the slightest bit by who I am and what I am. I love this place, and I think the district values who I am.” Also, Halle, an African-American administrator shared:

I think there are personal connections that make you want to come and talk with people, do this work with people. You appreciate conversations, feedback and just the relationship. I think that’s been enormous and just sort of this urgency around ensuring that kids of color have the right educational footing to begin their journey. That keeps me coming back every single day.

Furthermore, Paula powerfully and succinctly stated, “I’m satisfied with where I work and the kids I have in front of me. … I have no desire to teach anywhere else.” Finally, teachers also shared experiences about encountering families in the Cityside neighborhoods where students live and visiting families’ homes. The supportive connections with families was reinforced in the job satisfaction survey as well; 91% of teachers believed that parents support the work educators do in school.

Participants in this study value access to professional development, leadership opportunities, resources, and feeling appreciated due to their ethnicity. As mentioned before, when speaking about creating connections and relationships, participants commented how feeling connected to the school and the district helps them feel supported. Additional factors that
contributed to the feeling of connectivity included sharing the same cultural background as a supervisor and the diverse student population of Cityside.

Recommendations for Practice

The findings of the six individual case studies included in this research study informed the following recommendations, which fall under the theme of culturally proficient practices.

Culturally Proficient Practices

Educators of color interviewed in this study articulated that cultural proficiency practices differ from building to building and there is a need for greater uniformity and consistency across the district. Areas of need that fall under this theme include the exploration of implicit racial bias, recruitment and hiring, affinity work groups, and professional development. In order to address implicit bias and expand upon the work the district has begun with regard to the above-mentioned areas, it is highly recommended that Cityside continue its commitment to the allocation of fiscal resources for this important work.

Implicit racial bias. To address the implicit bias referred to by the participants in this study and to increase culturally proficient practices, it is recommended that the district explicitly recognize that the work of increasing cultural proficiency is the shared responsibility by all stakeholders. In response to developing a shared responsibility, the district can identify tools to assess their current practices. The data collected from using such tools should be reviewed, disaggregated and communicated to all stakeholders in the district. As a result, subsequent discussions can lead to a collaborative effort that explores implicit bias.

Recruiting and hiring educators of color. While Cityside maintains a goal to increase the diversity in their educator workforce to 30%, specific areas were identified for improvement. Interview data supports that active recruitment of educators of color is taking
place in some of the schools within the district. However, participants confirmed that this active recruitment is not taking place in all schools throughout the district. Findings suggest that a subset of administrators of color and a selected number of White administrators may be the catalysts for the recruitment through their use of social networking. Thus, all administrators should explore the practice of tapping into various networks that are likely to identify candidates of color to fill vacant positions within the district. Given that social networks are frequently racially segregated, White administrators will need to communicate with administrators and educators of color to identify which networks will lead them to a robust pool of candidates of color during the recruitment and hiring process.

It is also recommended that the newly hired diversity director work closely with building based administrators to ensure that the district recruitment and hiring practices are being consistently implemented. This includes the district’s expectation that all hiring administrators submit a list of candidates for a particular position to verify that a certain percentage of candidates are educators of color.

We further recommend that CPS consider how they articulate their stated commitment to hire more educators of color. It is not simply to increase the number of educators of color or to race-match student demographics, but rather it is also to improve the learning environment for all students by tapping into their professional repertoire and rich cultural background, and their unique ability to serve as role models for all students.

**Affinity work groups.** It is also recommended that CPS create opportunities for educators of color to interact with each other thereby eliminating the feeling of isolation that was expressed by a critical number of study participants. While it appears that there are opportunities
for social networking amongst Black educators in the district, it is recommended that these social networking opportunities be expanded to include all racial and ethnic backgrounds.

**Professional development.** Cityside’s administration has shown a commitment to a culturally responsive learning environment, as evidenced by Cityside’s strategic plan that includes “expanding rigorous, joyful, culturally responsive learning experience for all students.” This work is reflected in the cultural proficiency professional development opportunities provided for faculty discussed previously. While this work is considered important by the study participants, it is not sufficient to address the complex topic of race. Due to the urgency of addressing race, we recommend that district administrators prioritize professional development opportunities that explicitly focus on race and how to conduct conversations about race with an emphasis on ensuring that educators of color are not solely responsible for enhancing cultural proficiency in the district.

**Connections and relationships with students.** Some educators of color acknowledged their confidence with building strong connections with students of color, yet they struggled in building those same relationships with White students. It is recommended that professional development opportunities include a focus on building trusting relationships with all students regardless of racial and ethnic backgrounds. These conversations will increase cultural awareness, the understanding of racial and ethnic differences, and decrease the tendency to make judgments based upon stereotypes and misinformation.

**Culturally responsive pedagogy.** Many educators of color specifically addressed how their racial and/or ethnic identity influences their instructional practices. As an example, one biracial educator articulated that she strives to build greater understanding of diversity within the curriculum and instructional materials to which she exposes her students. She spoke of how she
intentionally creates opportunities for students to experience more cultural diversity in the texts they read in class and highlights the racial and/or ethnic background of authors and characters to promote conversation of diversity that includes all students in their classroom. We recommend that the district analyze the curriculum and instructional practices used to ensure there is an understanding of racial and/or ethnic backgrounds and cultural differences to help students set higher academic expectations for themselves without losing a sense of their cultural identity.

*Culturally responsive discipline.* Some interviewed participants discussed their impact on discipline and found that they were able to respond more appropriately to certain behaviors, especially of students of color. In addition to the above recommendation related to connections and relationships with students, it is recommended that CPS broaden its implementation of restorative justice practices to manage student discipline across all school levels. We further recommend that CPS develop a system to track discipline referrals to identify trends that may lead to changes in practice.

*Mentors.* Experiences of existing CPS educators of color indicate that strengthening the practicum student to employee relationship can be a successful way to increase the number of educators of color in CPS, make for a smooth transition, and increase retention. Drawing upon their existing relationships with university schools of education, CPS should examine ways to strengthen its recruitment of practicum students of color into the CPS schools. Further, in addition to formal culturally proficient professional development, we recommend that the district provide job-embedded professional development that includes assigning mentors of color for pre-professional teachers as well as other educators of color.

*Evaluation.* An analysis of Cityside’s evaluation process suggests that all administrators who are responsible for evaluating personnel participate in cultural competency training to
reflect on their own personal biases related to race. A notable number of participants in this study expressed a concern as to whether or not their White evaluators understood who they were as individuals and their mission to service the students of color present in their classrooms. A further recommendation includes a focus on how evaluators frame their feedback that exhibits an understanding of the challenges that face educators of color and the students of color they serve in their classrooms.

**Equity audit.** In order to address the inherent racial bias found within Cityside’s policies, systems and structures, it is recommended that Cityside conduct an equity audit. The educators of color interviewed demonstrated a passion for providing counter narratives to combat stereotypes and low expectations for students of color and they should be seen as beacons for other educators. Conducting an equity audit will provide opportunities to capture the voices of Cityside educators of color through the use of surveys, interviews, and focus groups. It must not be overlooked that institutional racism and bias exists in the structure of Cityside’s school policy development, implementation, and oversight. Policies and practices identified by this study includes hiring, mentoring, discipline, instructional practices, educator evaluation, and retention.

**Limitations and Recommendations for Future Research**

Recognizing the inherent limitation of a case study involving only one site and due to the limited sample size in this study, the ability to generalize some of the findings across the Cityside district as well as to other school districts in Massachusetts is difficult. This research group acknowledges the limitation of deriving implications from a study that interviewed 25 educators of color (14 of whom identified as Black or African-American) and three White educators, administered the MEIM to 24 interview participants, and surveyed 40 educators of color on job satisfaction, all of whom work in the same district. However, the findings derived
from the six individual focus areas strongly illuminate the importance of addressing racial disproportionality in the educator workforce and offer implications for changes needed in policy, practice, and future research.

A goal of our study was to identify further research needed to address and narrow the racial disproportionality of the educator workforce that exists within public schools across the United States. The need for additional research to understand how educators of color develop strong nurturing relationships with students grew from this study. In addition, further research is necessary to identify elements that contribute to a safe and supportive workplace environment for educators of color. There is a significant gap in research on racial and ethnic identity and its direct impact on student achievement, necessitating further research in this area. Furthermore, while there is a plethora of research to support the disproportionate discipline of Black and Latino students, there is limited research addressing the biases in discipline policy and practice implementation.

A future study recommendation is to implement a similar study with all educators in the district to compare how all educators have experienced teacher preparation, recruitment and hiring, racial identity, student discipline, evaluation and overall job satisfaction. This could allow researchers to see the overall strengths and challenges of the district, as seen by all educators, and compare the experiences of educators based on race. A broader study like this could also allow researchers to analyze the impact of having a same-race principal or principal of color versus a White principal for educators of color. A similar study, including a job satisfaction survey and exit interview, focused on educators who recently left the district could also be implemented to learn how these educators experienced working for the district and how their experiences impacted their decision to leave the district.
Conclusion

At the beginning of our study, we sought to answer the research question, how do educators of color experience racial disproportionality within the educator pipeline and schools? The findings from this case study helped to identify some best practices for teacher preparation programs, hiring and retaining educators of color, the impact of racial and ethnic identity on students and student discipline practices, educator evaluation, and increasing educator satisfaction. Additionally, findings included educators’ perceptions of the presence of racial bias in teacher preparation programs, district hiring practices, school climate and culture, classroom instruction and evaluation practices. This study illuminated how educators’ racial and ethnic identity influences students as well as the overall climate and culture of the school. Recognizing the urgency of this work, it is anticipated that this study will benefit practitioners as it directly relates to the work of the Massachusetts Department of Elementary and Secondary Education (DESE) to develop a more diverse educator workforce in the Commonwealth of Massachusetts and add to the scholarly discourse on how educators of color perceive and experience the racial disproportionality that exists within the hiring pipeline and schools.

Abstract for Charles J. Drane III’s Individual Study

Racial Disproportionality as Experienced by Educators of Color: The Perceptions of Educators of Color with Respect to their Pre-service Preparation

Even before working in school as a teacher or administrator, many factors were influential in the preparation process. Given that the vast majority of teachers in the workforce come from traditional university education programs, the role that schools of education play in graduating people of color to enter the teaching force is important to examine. This qualitative case study sought to answer the following research question: What are the perceptions of educators of color with respect to their pre-service education preparation? This study falls within a broader study on the overall perceptions of educators of color with respect to the racial disproportionality and its impact on the educator pipeline and schools. Both from literature and the counter narratives of these educators of color, these topics emerged as salient: the racial diversity of universities and schools of education, the impact of barrier exams, the curriculum of schools of education, and the sense of belonging of people of color in universities and their schools of education. Semi-structured interviews with 12 educators of color in the Cityside Public Schools were examined through the lens of Critical Race Theory (CRT). Findings supported what was found in the literature regarding demographics in schools of education not favoring people of color, exams required to get into school of education being barriers, and people of color feeling disconnected from their universities in a number of ways. Further, participant interviews revealed the additional barrier posed by exams needed to gain teaching certification, the substantial value of connections at various points throughout the pre-service experience, and how important practicum and internship experiences are to aspiring educators.
Appendix B

Abstract for Leslie M. Patterson’s Individual Study

Racial Disproportionality as Experienced by Educators of Color: Recruiting and Hiring

This qualitative case study explored how educators of color experienced recruitment and hiring practices in the Cityside Public School District (pseudonym). It was part of a larger group case study that sought to capture the perceptions of educators of color related to racial disproportionality and its impact on the educator pipeline and schools. Two research questions guided this individual study: (1) How do Cityside educators of color experience Cityside’s recruitment and/or hiring processes? (2) What practices and policies might Cityside school and district level leaders utilize to increase the number of educators of color recruited and hired? Data for this study were collected from semi-structured interviews with nine Cityside faculty of color and with six Cityside administrators (of different races), as well as from a document review. Analysis of these data through the lens of Critical Race Theory (CRT) revealed study participants’ perception that implicit racial bias had the potential to negatively impact Cityside's hiring of educators of color. Additionally, leveraging social networks as an essential recruitment strategy to increase the presence of educators of color, and the benefits of hiring committees with a racially diverse membership, emerged as key findings. Finally, this study illuminated counter narratives that powerfully captured instances of microaggressions and perceived racism experienced by Cityside educators of color. Recommendations include requiring professional development with an anti-bias focus for all hiring committee participants, increasing the utilization of social networks to enhance recruitment efforts, ensuring a racially diverse composition of hiring committees, and actively seeking the counter narratives of Cityside educators of color.

Abstract for Joan M. Woodward’s Individual Study

Racial Disproportionality as Experienced by Educators of Color:

Perceptions of the Impact of Their Racial and/or Ethnic Identity on Their Work with Students

Research has indicated that hiring and retaining educators of color can positively impact students of color, as educators of color have the capacity to be social justice change agents (Villegas & Davis, 2007), serve as strong role models for students of color (Ingersoll & May, 2011), promote culturally responsive curriculum (Ladson-Billings & Tate, 1995), and positively impact student achievement (Ahmad & Boser, 2014; Dee, 2004). However, there is a significant gap in the existing research on how educators of color perceive the impact of their racial/ethnic identity on their work in the classroom. This qualitative case study sought to answer how educators of color perceive the impact of their racial and/or ethnic identity on their relationships with students, their instructional practices, and the reduction of cultural bias in their school. It was part of a larger group case study that sought to capture the perceptions of educators of color related to racial disproportionality and its impact on the educator pipeline and schools. Data was collected through semi-structured face-to-face interviews and the administration of the Multigroup Ethnic Identity Measure protocol with educators of color in the Cityside Public School District. Data was examined through the lens of Critical Race Theory (CRT), specifically the tenets of permanence of racism, critique of liberalism, and counter storytelling. Findings support that the majority of the participants interviewed have a strong sense of belonging to their racial and/or ethnic group. Moreover, educators of color perceive that they serve as positive role models, provide students of color with culturally responsive pedagogy, and offer counter narratives that combat stereotyping.
Appendix D

Abstract for Roderick V. MacNeal, Jr.’s Individual Study

Racial Disproportionality as Experienced by Educators of Color:
The Evaluation Process and Educators of Color

The purpose of this individual study was to address the gap in research and answer the following research question: How do educators of color perceive the evaluation process and its impact on their growth and development? It was part of a larger group case study that sought to capture the perceptions of educators of color related to racial disproportionality and its impact on schools. As educators of color work to maintain a presence within the educational system, it is essential to study how perceived biases related to race may impact the evaluation process. This single case study attempted to capture how five administrators of color and five teachers of color employed by the Cityside Public School District perceived the evaluation process used within their district. Additionally, a document review of union contracts was used to ascertain the evaluation process used by Cityside. The Critical Race Theory tenets of permanence of racism, counter storytelling and critique of liberalism provided a theoretical framework to analyze the responses given by each participant who participated in semi-structured interviews. Findings reveal that the majority of the participants do not believe the evaluation process has improved their growth and development. Other findings revealed that the racial identity and the level of cultural competency of the evaluator impacted whether or not participants believed their race was a factor in how they were evaluated.

Abstract for Diana Guzzi’s Individual Study

Racial Disproportionality as Experienced by Educators of Color:

Job Satisfaction of Teachers and Administrators of Color

This individual study was part of a larger group case study that sought to capture the perceptions of educators of color related to racial disproportionality and its impact on the educator pipeline and schools in the Cityside Public Schools (pseudonym). The purpose of this study was to identify factors that influence job satisfaction for teachers and administrators of color and how teachers and administrators of color perceive how these factors might influence their job retention. This study included both teachers and administrators of color from one urban school district in Eastern Massachusetts, the Cityside Public Schools (CPS). Data sources included 11 semi-structured interviews with educators of color and 40 completed Likert scale surveys measuring job satisfaction and retention. The data was collected during one month. All data was coded thematically using three levels of ecological framework, as well as factors that contribute to job satisfaction and retention. The interview data was coded first, and then the survey data was coded. The data was coded using identified themes from previous research, as well as new themes that emerged from the interviews. All the data was then combined and synthesized to determine findings and make recommendations. This study found that many of the Cityside participants were satisfied with their job, while still recognizing that their work is challenging. Factors that influenced their job satisfaction were embedded in themes of connections, support, racial identity, resources and fatigue. These factors, except for the last, predicted slightly higher rates of perceived retention within the district among the teachers of color than the administrators of color.
Good morning colleagues.

I am pleased to share with you that CPS is partnering with a team of Doctoral Students from Boston College who are currently researching a range of elements associated with the topic of Racial Disproportionality as Experienced by Educators of Color.

During this first week of November, each CPS educator who has self-identified as a person of color is receiving both information about the research project and contact information if interested in participation in the study.

As stated by the B.C. Team: *The purpose of our group study is to explore how educators of color experience racial disproportionality within the educator pipeline and schools. Specifically, we will consider the perceptions and experiences of educators of color related to their pre-service programs, recruitment and hiring, job satisfaction, student discipline, racial/ethnic identity, and the evaluation process. We use the conceptual framework of Critical Race Theory to guide our study.*

The Survey/Interview window for interested CPS Educators will take place between November 6-12.

Thank you in advance for your attention to this endeavor,

* A copy of your invitation to participate in this research project is included below. *

Please feel free to contact me directly if you have any questions prior to responding to the Boston College research team.

Boston College Research Study Invitation and Information Recruitment Email

Dear Cityside Public Schools Educator,

A research team from Boston College is engaged in a project to study the experiences of educators of color. Simply stated, the disproportionality that exists between the number of educators of color and students of color is alarming and demands attention. Our study looks to draw upon the actual experience of educators to help us form recommendations to address this issue.

Because our work relies on the experiences of educators in the field, our main source of data will come from interviews. We are reaching out to you, as an educator of color, to inquire whether you would be willing to participate in a 60-minute interview. Prior to the interview, you would also be asked to complete a survey, the Multigroup Ethnic Identity Measure (MEIM), to provide the interviewer with context for the interview. The Cityside Public Schools is aware of our commitment to maintain the confidentiality of those who are willing to participate. At no time will you be identified individually, but the collective experience will generate a rich source of data.

If you are willing to participate, we ask that you email me at dranec@bc.edu and we will follow up with more details and work to schedule a mutually convenient time. We appreciate in advance your consideration of this request.

Whether or not you wish to participate in an interview, we would welcome your participation on a job satisfaction survey. Please click this link https://bostoncollege.co1.qualtrics.com/jfe/form/SV_9tWHmAzMKVqUKrj to begin the survey.

Sincerely,
Charlie Drane

Appendix H
Online Job Satisfaction Survey

You are being asked to participate in a research study about how educators of color experience the racial disproportionality within the educator pipeline and schools. You were selected to be in the study because you self identify as being an educator of color or non-white educator. All educators of color from your district, including faculty and administrators, are being invited to participate in this survey. The survey should take you approximately 15-20 minutes to complete, depending on how much you choose to share. The online survey includes questions about factors that contribute to job satisfaction as well as your short-term and long-term professional goals. There are no direct benefits to you, but you may feel gratified knowing that you helped further work in this important area. In terms of risks, the survey may ask questions that you consider sensitive. If you don’t wish to answer a question, you need not do so. The study may include risks that are unknown at this time. There is no payment or compensation for participating in this study. There are no costs to you associated with your participation. All reasonable efforts to keep your responses and your identity confidential will be made. The records of this study will be kept private. In any sort of report we may publish, we will not include any information that will make it possible to identify you. All electronic information will be secured using a password protected file. Please note that regulatory agencies, the Boston College Institutional Review Board, and Boston College internal auditors may review research records. Your participation is voluntary. If you choose not to participate it will not affect your relations with Boston College. You are free to withdraw or skip questions for any reason. There are no penalties for withdrawing or skipping questions. The lead researcher conducting this survey is Charles Drane. For questions or more information concerning this research you may contact him at: dranec@bc.edu. The Boston College faculty advisor for this study is Lauri Johnson, lauri.johnson@bc.edu. If you have questions about your rights as a research participant, you may contact the Office for Research Protections, Boston College, at 617-552-4778 or irb@bc.edu. This study was reviewed by the Boston College Institutional Review Board and its approval was granted on [insert approval date]. If you agree to the statements above and agree to participate in this study, please press the “Consent Given” button below.

Multigroup Ethnic Identity Measure
Phinney, J. (1992)

You are being asked to participate in a research study about how educators of color experience the racial disproportionality within the educator pipeline and schools. You were selected to be in the study because you self identify as being an educator of color or non-white educator. All educators of color from your district, including teachers and administrators, are being invited to participate in this survey. The survey should take you approximately 10-15 minutes to complete, depending on how much you choose to share. The online survey includes questions about your race, ethnicity or your ethnic group and how you feel about it or react to it. There are no direct benefits to you, but you may feel gratified knowing that you helped further work in this important area. In terms of risks, the survey may ask questions that you consider sensitive. If you don’t wish to answer a question, you need not do so. The study may include risks that are unknown at this time. There is no payment or compensation for participating in this study. There are no costs to you associated with your participation. All reasonable efforts to keep your responses and your identity confidential will be made. The records of this study will be kept private. Interview Protocol for Pre-service, Recruiting and Hiring

Opening Reminders
Opening reminders of practices we will remember when collecting information in the interview.
- We will be recording this interview.
- At any time of this interview you can request that I turn off the recording device.
- After collecting our data we will ensure that schools and/or leaders are not being identified individually.
- The data we collect from this research project will eventually be shared with your central office. However, at no time will your individual responses be shared with anyone in central office or your district’s school committee.
- All interview questions are optional.
- At any time during the interview you can request to end the interview.

Introduction Questions
- Tell me/us about your role.
- How many years have you been in this role?
- What led you to your current position?
- What inspires you in this role?
- What do you find challenging in this role?
- This research focuses on the experience of educators of color. Do you feel comfortable identifying your race and/or ethnicity? If so, how do you identify racially and/or ethnically?

Questions for educators of color:

1. What path did you take to the field of education (i.e. university school of education, from the workforce, from an alternative certification program such as Teach for America)?

(Questions 2 - 6 are only for those who came from the university school of education path.)

2. How did your teacher education shape the educator you are today?

3. How would you describe the racial makeup of your school of education?

4. How, if at all, did your teacher education program address issues of race or culture?

   **Prompt:** Did you learn about specific strategies or curriculum for working with students of diverse racial and cultural backgrounds? If not, why not?

5. Were you required to pass an exam (such as Praxis I) in order to enroll in the school of education? If yes, how did you find the exam? How many attempts did it take for you to pass?

   **Prompt:** If MTEL was not mentioned, probe about experiences on the MTEL.
6. How would you describe the climate and your sense of belonging in the school of education?

**Prompt:** If race was not discussed, probe about how race played into belonging.

7. How did you experience the recruitment and hiring process for Cityside?

**Prompt:** How did you learn about the job opening?

**Prompt:** If you attended a job fair, please describe this experience.

**Prompt:** What factors contributed to your decision to apply?

**Prompt:** Please explain the interview process (including hiring committee makeup, questions asked, number and types of rounds, etc.) in as much detail as possible.

**Prompt:** What factors contributed to your decision to accept the job offer?

**Prompt:** How, if at all, did the racial composition of the teaching force impact your decision to apply to Cityside and/or accept the job?

8. How did you prepare for the interview process?

**Prompt:** Were there choices you made about your physical and/or oral presentation? If Yes, please describe.

**Prompt:** How, if at all, did your race impact your physical and/or oral presentation?

9. What is your perception of Cityside’s efforts to hire and support teachers and administrators of color?

**Prompt:** Can you describe an instance when a job applicant’s ethnicity/race made a difference (good or bad) during the recruiting and hiring process in Cityside?

10. Would you like to share any other relevant information?
Appendix K

Interview Protocol for Administrators: Recruiting and Hiring

Opening Reminders
Opening reminders of practices we will remember when collecting information in the interview.

- We will be recording this interview.
- At any time of this interview you can request that I turn off the recording device.
- After collecting our data we will ensure that schools and/or leaders are not being identified individually.
- The data we collect from this research project will eventually be shared with your central office. However, at no time will your individual responses be shared with anyone in central office or your district’s school committee.
- All interview questions are optional.
- At any time during the interview you can request to end the interview.

Introduction Questions

- Tell me/us about your role.
- How many years have you been in this role?
- What led you to your current position?
- What inspires you in this role?
- What do you find challenging in this role?
- This research focuses on the experience of educators of color. Do you feel comfortable identifying your race and/or ethnicity? If so, how do you identify racially and/or ethnically?

Questions for administrators directly involved with hiring process:

1. What level of priority does Cityside give to hiring and recruiting educators of color?

   Prompt: (If high priority . . ) What motivates you and/or Cityside to make this a priority?

2. Please describe the recruiting and hiring practices and policies utilized by your school/Cityside.

   Prompt: Please include a detailed description of the interview process (including hiring committee makeup, questions asked, number and types of rounds, etc.).

   Prompt: Which, if any, of these practices and policies are in place specifically to support the recruiting and hiring of educators of color. Please explain.

   Prompt: Which of these practices and policies do you believe to be the most effective for engaging candidates of color? Why?

3. Please describe your school’s/Cityside’s recruitment materials available to job applicants (e.g. brochures, website information).
Prompt: Which, if any, of these recruitment materials are designed and/or created to intentionally attract candidates of color? Please explain.

4. What are the characteristics of your school/Cityside that you believe candidates of color find the most attractive?

5. Please describe any anti-bias/diversity training that you have had.

   Prompt: What year did training take place? Who sponsored it?

6. How, if at all, has this anti-bias/diversity training informed your hiring and/or recruiting efforts for your school/Cityside?

7. How successful do you feel that your school/Cityside has been in recruiting and hiring educators of color.

   Prompt: What does your school/Cityside need to do differently to increase success?

8. Does your school/Cityside have any recruiting/hiring documents that I could access?

9. Do you believe that teachers are better prepared for the profession if they come from university teacher education programs, the workforce, or alternative programs (like Teach for America, for example)? Why?

10. Would you like to share any other relevant information?
Appendix L

Interview Protocol for Student Discipline and Student Impact

**Opening Reminders**
Opening reminders of practices we will remember when collecting information in the interview.
- We will be recording this interview.
- At any time of this interview you can request that I turn off the recording device.
- After collecting our data we will ensure that schools and/or leaders are not being identified individually.
- The data we collect from this research project will eventually be shared with your central office. However, at no time will your individual responses be shared with anyone in central office or your district’s school committee.
- All interview questions are optional.
- At any time during the interview you can request to end the interview.

**Introduction Questions**
- Tell me/us about your role.
- How many years have you been in this role?
- What led you to your current position?
- What inspires you in this role?
- What do you find challenging in this role?
- This research focuses on the experience of educators of color. Do you feel comfortable identifying your race and/or ethnicity? If so, how you identify racially and/or ethnically?

**Student Discipline:**

1. Tell me about the discipline system in your district.

   **Prompt:** Does the district use any alternative discipline practices, such as a restorative justice approach or progressive discipline?

   **Prompt:** How does the district collaborate, if at all, with families to improve student behavior?

2. How, if at all, does the administrative team review discipline cases to look for patterns or trends?

   **Prompt:** Does the team consider race/ethnicity of the disciplinarian and the student when evaluating discipline data?

3. Do teachers of color and White teachers assess students’ behavior differently? If so, how? How, if at all, does the district’s code of conduct affect different racial groups of students?

   **Prompt:** Does the discipline code reflect an understanding of students with different cultural backgrounds and belief systems? (The “braid/hair extension” controversy at a charter school.)
**Prompt:** Do you work to understand the student’s cultural background when providing him/her with due process?

4. Do you see any disparity in the rate or severity of discipline consequences assigned to students?

**Prompt:** Do you see a difference in the rate at which Black students are disciplined in relation to their White peers?

**Prompt:** Do students receive similar consequences for displaying similar types of behavior?

5. Do you have any concerns about the distribution of exclusionary discipline practices in this district?

**Prompt:** Are Black students assigned suspensions or expulsions at a higher rate when compared to their White peers?

**Impact on Students:**

6. Does your race or ethnicity impact the students in your classroom / school / district? If so, how?

**Prompt:** In what ways do you think your racial/ethnic identity drives the strategies you employ to teach/lead?

**Prompt:** How, if at all, has your racial/ethnic identify impacted cultural biases in the classroom/school/district?

7. Has race ever come up in your teaching experience? Tell me about it

**Prompt:** Has that impacted how you teach?

**Prompt:** What did you learn from that experience?

8. Does your school/district talk about race? If not, why not?

**Prompt:** How does it impact your teaching?

**Prompt:** What changes would you like to see in your schools/district?

9. How, if at all, does the fact you are a teacher of color influence your relationships with students of color? With White students?
Appendix M

Interview Protocol for Evaluation and Job Satisfaction

Opening Reminders
Opening reminders of practices we will remember when collecting information in the interview.

- We will be recording this interview.
- At any time of this interview you can request that I turn off the recording device.
- After collecting our data we will ensure that schools and/or leaders are not being identified individually.
- The data we collect from this research project will eventually be shared with your central office. However, at no time will your individual responses be shared with anyone in central office or your district’s school committee.
- *Interview focus:* This interview will focus on your experiences with the evaluation process and overall job satisfaction.
- All interview questions are optional.
- At any time during the interview you can request to end the interview.

Introduction Questions

- Tell me/us about your role.
- How many years have you been in this role?
- What led you to your current position?
- What inspires you in this role?
- What do you find challenging in this role?
- This research focuses on the experience of educators of color. Do you feel comfortable identifying your race and/or ethnicity? If so, how you identify racially and/or ethnically?

Focus Questions

**Evaluation Process**

1. Please describe the evaluation process for this district.

2. How has the evaluation process impacted your growth and development as an educator? (Please, give examples)

3. What, if anything, would you change about the process?

4. How would you describe the impact, if at all, of your race/ethnicity on how you have been evaluated?

**Job Satisfaction and Retention**

1. How would you describe your overall job satisfaction?

   **Prompt:** What other factors contribute to your job satisfaction?

2. What, if anything, could improve your job satisfaction?

3. How do you think your race and/or ethnicity impacts your job satisfaction?
4. How long do you plan to work for the identified school district and in what capacity?

Closing Question and Remark
Is there anything else you would like to add regarding your experience as an educator of color within the school district?

Thank you for taking time to participate in our research. We value your input.

Educator of Color Consent Form

BOSTON COLLEGE
Lynch School of Education
Professional School Administrator Program

Research Study: Racial Disproportionality as Experienced by Educators of Color
Lead Researcher: Charles Drane

Individual Consent Form

Introduction:
You are being asked to participate in a research study about how educators of color experience the racial disproportionality within the educator pipeline and schools. You were selected to be in the study because you self-identified to participate in the research study as an educator of color who works within the district. Please read this form. You may ask any questions that you have before you agree to be in the study.

Purpose of Study:
The purpose of this single site case study is to explore and understand the experiences of educators of color in light of the persisting racial disproportionality within the educator pipeline and schools in a Massachusetts district. The educator pipeline refers to the preparation, recruitment, professional experiences related to students and colleagues, and retention of educators. Specifically, we will consider the experience of educators of color and their perceptions related to pre-service programs, recruitment and hiring, student discipline, their racial/ethnic identity as it impacts students, evaluation, and job satisfaction.

The research will be conducted in Cityside Public Schools [pseudonym] where 24% of its staff are educators of color. The staffing racial and ethnicity demographics do not reflect its student population which is 60% students of color. Faculty and administrators of color within this district will be invited to participate in this research, between 18-24 respondents will be self-identified to participate in semi-structured interviews. Additional building and district level administrators, including the Superintendent of Schools, Deputy Superintendent, Assistant Superintendents, Business/Finance Manager, Director of Human Resources, and Principals may be interviewed to address questions related to an area of the educator pipeline identified in this study.

What Will Happen in the Study:
If you agree to be in this study, you will be asked to participate in one semi-structured interview facilitated by one or two of the researchers and complete a short survey. The survey, called the Multigroup Ethnic Identity Measure (MEIM), will only be used to provide context for
the interviewer and will not be shared with anyone outside of the research team. This interview will last up to one hour and take place in a mutually agreed upon location. It will be recorded.

**Risks and Discomforts of Being in the Study:**
There are no expected risks, however, there is a possibility that participants may share experiences that trigger discomfort or negative emotions. Participants will be reminded that they can choose not to answer a question for any reason and end the interview at any time. Thus, participants can choose not to reveal information that they feel is sensitive or uncomfortable. This study may include risks that are unknown at this time.

**Benefits of Being in the Study:**
The purpose of this single site case study is to explore and understand the experiences of educators of color in light of their persisting racial disproportionality within the educator pipeline and schools in a Massachusetts district. The participants may derive some benefit from having the opportunity to discuss and reflect on their experiences and perceptions of racial disproportionality within the district. Further, the district may benefit from the information gleaned from the interviews and information gathered during this study. However, no benefit to the participants can be assured.

**Payments:**
There is no payment or compensation for participating in this study.

**Costs:**
There is no cost to you to be in this research study.

**Confidentiality:**
Participants’ identity will remain anonymous throughout the research and reporting of this study. The records of this study will be kept private. In any sort of report we may publish, we will not include any information that will make it possible to identify you. All electronic information will be coded and secured using a password-protected file, this includes transcripts of interviews. Audio files will be deleted upon the completion of this study. Mainly just the researchers will have access to information; however, please note that a few other key people may also have access. These might include the Institutional Review Board at Boston College and internal Boston College auditors. They have the right to review the research records.

**Choosing to be in the Study and Choosing to Quit the Study:**
Choosing to be in this study is voluntary. If you choose not to be in this study, it will not affect your current or future relations with the Cityside Public Schools [pseudonym] or Boston College. You are free to quit at any time, for whatever reason.

**Getting Dismissed from the Study:**
The researcher may dismiss you from the study at any time for the following reasons: (1) it is in your best interests (e.g. your identity cannot remain anonymous), or (2) you have failed to comply with the study rules.
Contacts and Questions:
The lead researcher conducting this study is Charles Drane (dranec@bc.edu). The Boston College faculty advisor for this study is Lauri Johnson, lauri.johnson@bc.edu. For questions or more information concerning this research you may contact the lead researcher via email.

If you have any questions about your rights as a person in this research study, you may contact: Director, Office for Research Protections, Boston College at (617) 552-4778, or irb@bc.edu

Copy of Consent Form:
You will be given a copy of this form to keep for your records and future reference.

Statement of Consent:
I have read (or have had read to me) the contents of this consent form. I have been encouraged to ask questions. I have received answers to my questions. I give my consent to be in this study. I have received (or will receive) a copy of this form.
